Executive summary

Arbtech Consulting Ltd was commissioned by George Hickman to undertake bat emergence and re-entry surveys at 1 St James' Road, Hampton Hill, Hampton, Richmond-Upon-Thames, TW12 1DH. The surveys were completed on 19th May and 2nd June and 17th June 2020. The aim of the assessment was to confirm the presence/likely absence of a bat roost in the building, and to provide an assessment of the current status of all the survey features. This includes providing evidence for species, numbers and levels of activity, to identify any entrance and egress points, and to gain an understanding of the activity of bats using the site in the local landscape.

Project description

This report was prepared to inform a future planning application with London Borough of Richmond upon Thames. The proposed development is described as:

“Demolition of existing dwelling and construction of nine flats with landscaping and carparking”.

Recommendations

A day roost of one soprano pipistrelle bat has been identified on the north east roof-pitch of Building 1. **A European protected species mitigation licence (EPSML) will be required from Natural England prior to the commencement of works, once planning has been granted. As a low number of common species of bat is present, the site is eligible for a bat mitigation class (low impact) licence (BMCL).** See section 4.2 for full details.

1.0 Introduction and Context

1.1 Background

The assessment is informed by the Bat Conservation Trust Publication *Bat Surveys for Professional Ecologists – Good Practice Guidelines* (Collins, J. (Ed) 2016).

These surveys were completed following recommendations made in the preliminary roost assessment (PRA) survey report (Arbtech, April 2020).

1.2 Site Context

The site is located at National Grid Reference TQ 1382 7120 and has an area of approximately 0.1ha. The site consists of one residential dwelling with amenity gardens.

1.3 Scope of the report

This report provides a description of the bat activity observed and recorded during each survey. The aim of the assessment was to characterise any roosts present including species, number of individuals, number and location of roost access points, and to gain an understanding of how bats use the site.

Robust data has been collected, following good practice guidelines, to inform an assessment of the potential impacts of the proposed development on bats, and inform mitigation and enhancements. This report provides information on constraints to the proposals as a result of roosting bats, and summarises any mitigation required to achieve planning permission, and statutory consent to comply with wildlife legislation.

To achieve the aims of the assessment, the following steps have been taken:

- A desk study has been carried out, including a request for information from the local bat group or records centre - please refer to the PRA report (Arbtech, April 2020)
- Field survey(s) has been undertaken, including an external survey and internal inspection.
- An outline of likely impacts on any known roosts has been provided, based on current development proposals.
- Recommendations for further survey and assessment have been made, along with advice on the requirements of a European protected species mitigation licence (EPSML) application if appropriate.

A survey plan is presented in Appendix 1 showing the location of each surveyor and the bat activity observed and recorded during each survey, proposed plans in Appendix 2 and a summary of relevant legislation is presented in Appendix 3.

1.4 Project Description

This report was prepared to inform a future planning application with London Borough of Richmond upon Thames. The proposed development is described as:

- Demolition of existing dwelling and construction of nine flats with landscaping and carparking.

2.0 Methodology

2.1 Desk Study methodology

The desk study included a 2km radius review of statutory and non-statutory designated sites, Biodiversity Action Plan (BAP) Priority Habitats and granted EPSML records for bats held on Magic database. An assessment of the surrounding landscape structure was also completed using aerial images from Google Earth and OS maps.

Existing bat records relating to the site and a surrounding 2km radius are required to conform to national guidelines. The data search is confidential information that is not suitable for public release and was analysed and summarised in the PRA. Please refer to the PRA report (Arbtech, April 2020).

2.2 Site Survey methodology

The survey methods were informed by the recommendations presented in the PRA (Arbtech, April 2020). This survey identified the following survey requirements in line with best practice:

Table 1: Recommended surveys

Ref	Survey assessment conclusions (with justification)	Recommendations
B1 Bats	The building, B1, has a moderate habitat value for supporting roosting bats. This is due to the presence of raised roof tiles on the south elevation which have created gaps which are suitable for crevice dwelling species of bat. Missing mortar on the north west corner provides another suitable roosting space for bats. Gaps below roof tiles are favoured by urban bats such as common and soprano pipistrelles. The nearby river provides an excellent foraging resource for urban bats increasing the likelihood that bats are in the local area.	Two dusk emergence/dawn re-entry surveys will need to be carried out to identify the roost access points and numbers of bats present. The surveys should be carried out in the optimal bat season between mid-May and August and will require two surveyors to provide full coverage of the building.

The surveys involved surveyors positioned around the building ensuring that all elevations and roof sections with suitable roosting features could be clearly observed. Particular attention was paid to the areas of the building identified as providing suitable access points to bat roosts. The location of each surveyor during each survey is shown in Appendix 1. Each surveyor was assigned an area of the building to observe for the duration of the survey. Surveyors used heterodyne and frequency division bat detectors, and Wildlife Acoustics EM3+ and Echo Meter Touch detectors connected to iPads. Bat echolocation calls recorded during the surveys were analysed using Wildlife Acoustics sound analysis software Kaleidoscope V3.1.7 when required. The Echo Meter Touch includes an auto ID function for bat species; however, this is not 100% accurate and further post-survey sound analysis is often required to confirm species that could not be identified by the auto ID software during the survey. Surveyors also used head torches, survey record sheets and pens/pencils for recording all activity observed during the surveys. Each surveyor was also provided with a handheld radio for communication between surveyors to assist with confirming ambiguous bat activity e.g. a bat emergence or a bat passing over the building.

In accordance with the latest bat survey guidelines (Collins, J. 2016) dusk emergence surveys commenced 15 minutes before sunset and continued for 1½ - 2 hours after sunset – depending upon bat activity and surveyor visibility. Dawn re-entry surveys commenced 2 hours before sunrise and continued until 15 minutes after sunrise.

Surveys were completed during optimal weather conditions i.e. when temperatures were above 10°C, with no rain or strong winds, as these adverse weather conditions can impact upon bat emergence and foraging behaviour.

2.3 Surveyors

The lead surveyor was Mark Taroni, and was assisted by an experienced surveyor with several years of bat survey experience. Two surveyors were used to provide sufficient cover of the building during each survey. The designated position of each surveyor during each survey is detailed in the tables in Section 3.1 below and shown on the plan in Appendix 1.

2.4 Limitations

These surveys follow best practice guidance to confirm presence/likely absence of roosting bats and where present, characterise the roost. However, this information is collected at finite dates and times, and provides an indication of the conditions on site only. The use of the building and the site as a whole by bats, at all times cannot be established based on this information.

There were no specific limitations to the survey.

3.0 Results and Evaluation

3.1 Survey Results

The results of each survey are provided in the tables below.

Table 2: Survey results

Date	19/05/2020	
Start and End Times	20:20 – 22:20 Sunset: 20:52	
Weather Conditions	Start: Temp: 19.8°C Relative Humidity:33% Cloud Cover: 20% Wind: 2mph Rain: None	End: Temp: 14.3°C Relative Humidity: 33% Cloud Cover: 30% Wind: 1.5mph Rain: None
Surveyor (position) As shown in Appendix 1	Mark Taroni – 3 yrs. experience of conducting bat surveys. (Position 1 – observing the north-east elevation and roof structure of B1). Narin Aker – 3 yrs. experience of conducting bat surveys. (Position 2 – observing the south-west elevations and roof structures of B1).	
Building Reference	Surveyor Position	Notes/observations:
B1	1	A silent pass by an unidentified bat was observed at 21:32. The bat flew from the south-west across the rear garden and continued north. A common pipistrelle was recorded at 21:38 flying from the south and continued north-west over the roof of B1. An emergence by a soprano pipistrelle was recorded at 21:41. The bat emerged from the tiles/eaves close to the eaves on the north-east corner and flew north above the surveyor. See below:

A final pass by a soprano pipistrelle was recorded at 21:58. The bat arrived from the south and continued north west above the surveyor.

B1

2

Soprano pipistrelles were heard not seen, between 21:16 and 21:27.

At 21:28 and 21:29, two soprano pipistrelles were observed passing south west to south-east across the garden.

Between 21:29 and 21:36 there was constant foraging activity by soprano bats, circling in the front garden. Occasional common pipistrelles were also detected during this time, including an unseen pass by a Nathusius' pipistrelle at 22:10.

Regular passes by soprano pipistrelles with foraging activity continued between 21:42 until 22:20. The bats were mainly using the front and side gardens on the south for foraging.

Table 3: Survey results

Date	02/06/20	
Start and End Times	03:20 –05:15 Sunrise: 04:48	
Weather Conditions	Start: Temp: 15°C Relative Humidity: 20% Cloud Cover: 30% Wind: 0.5mph Rain: none	End: Temp: 15°C Relative Humidity: 30% Cloud Cover: 30% Wind: 1mph Rain: none
Surveyor (position) As shown in Appendix 1	Mark Taroni – 3 yrs. experience of conducting bat surveys. (Position 1 – observing the south-west elevations and roof structures of B1). Narin Akar – 3 yrs. experience of conducting bat surveys. (Position 2 – observing the north-east elevations and roof structures of B1).	
Building Reference	Surveyor Position	Notes/observations:
B1	1	A pass by a soprano pipistrelle was recorded at 03:28. The bat arrived from the east and continued west across the roof of B1. Between 03:29 and 03:57 soprano pipistrelles were heard echolocating, but were unseen, with one further pass observed as a soprano pipistrelle passed over the roof at the south west-corner at 03:37. No further activity was observed.
B1	2	At 03:36 a Nathusius' pipistrelle was recorded, heard not seen. At 03:47 a direct pass by a soprano pipistrelle was observed across the north-west elevation. Between 03:47 and 04:12 soprano pipistrelles were heard echolocating but not seen.

Table 4: Survey Results

Date	17/06/20	
Start and End Times	21:00 – 22:40 Sunset: 21:21	
Weather Conditions	Start: Temp: 19°C Relative Humidity: 75% Cloud Cover: 100% Wind: 1mph Rain: none	End: Temp: 16°C Relative Humidity: 78% Cloud Cover: 40% Wind: 1mph Rain: ~2.5mm in the last 10 minutes
Surveyor (position) As shown in Appendix 1	Nicole Gullan – Accredited Agent on Natural England Bat Licence Number: 2019-43774-CLS-CLS. (Position 1 – observing the north-east elevations and roof structure of B1). Mirza Rashid -2 yrs. experience of conducting bat surveys. (Position 2 – observing the south-west elevations and roof structure of B1).	

Building Reference	Surveyor Position	Notes/observations: An internal inspection of the roof-void was conducted prior to commencement of survey. No evidence of the presence of bats was found.
B1	1	<p>Four distant passes by common pipistrelles were heard at 21:35, 21:41, 21:44 and 22:00.</p> <p>22:00 A commuting pass by a common pipistrelle from east to west, north of B1.</p> <p>22:02 A commuting pass by a soprano pipistrelle, from west to east, north of B1.</p> <p>22:04 A pass by a noctule bat was heard not seen.</p> <p>22:12 A direct, low pass by a common pip from south, past in front of the surveyor and continued to the east.</p> <p>22:14 A pass by a common pipistrelle with foraging activity was heard not seen.</p>
B1	2	<p>21:35- 21:57 Several passes by common pipistrelles with foraging activity in the rear gardens.</p> <p>22:02 A direct pass by a common pipistrelle flying south-east, then north towards the surveyor.</p> <p>22:03 Constant foraging activity by a common pipistrelle in the southern garden.</p> <p>22:06 A distant pass by a noctule bat was observed. The bat crossed west above the site.</p> <p>22:18 Foraging activity by a common pipistrelle in the rear south and west gardens.</p>

4.0 Conclusions, Impacts and Recommendations

4.1 Informative guidelines

When bat roosts are present, the bat surveys undertaken at a site facilitate the characterisation of the roost type. This allows for appropriate mitigation and compensation to be designed to inform a European Protected Species Mitigation Licence (EPSML) application to Natural England.

The definitions of bat roost types are provided below, taken from the *Bat Mitigation Guidelines* (English Nature, 2004) and the Bat Conservation Trust Publication *Bat Surveys for Professional Ecologists – Good Practice Guidelines* (Collins, J. (Ed) 2016).

Day roost: a place where individual bats, or small groups of males, rest or shelter in the day but are rarely found by night in the summer.

Night roost: a place where bats rest or shelter in the night but are rarely found in the day. May be used by a single individual on occasion or it could be used regularly by the whole colony.

Feeding roost: a place where individual bats or a few individuals rest or feed during the night but are rarely present by day.

Transitional / occasional roost: used by a few individuals or occasionally small groups for generally short periods of time on waking from hibernation or in the period prior to hibernation.

Swarming site: where large numbers of males and females gather during late summer to autumn. Appear to be important mating sites

Mating sites: sites where mating takes place from later summer and can continue through winter.

Maternity roost: where female bats give birth and raise their young to independence.

Hibernation roost: where bats may be found individually or together during winter. They have a constant cool temperature and high humidity. Sites where hibernating bats have been confirmed by appropriate survey effort should be classed as 'hibernation confirmed'.

Satellite roost: an alternative roost found in close proximity to the main nursery colony used by a few individual breeding females to small groups of breeding females throughout the breeding season.

Other: roost types are interchangeable and not always easy to classify according to the nuances of certain species.

The surveys undertaken to date in and around B1 provide sufficient information to inform a European protected species mitigation licence (EPSML). An EPSML **will be required** to enable the proposed works to be lawfully undertaken, whilst ensuring the favourable conservation status of the species concerned in their natural range; detailed mitigation will be described in the EPSML Method Statement. Appropriate justification for this assessment is provided in Section 3 of this report.

Natural England issues licences under Regulation 55 of the Habitats Regulations to allow you to work within the law. Licences are issued for specific purposes stated in the Regulations, if the following three tests are met:

- The purpose of the work meets one of those listed in the Habitats Regulations (see below);
- That there is no satisfactory alternative;
- That the action authorised will not be detrimental to the maintenance of the population of the species concerned at a favourable conservation status (FCS) in their natural range

The Habitats Regulations permits licences to be issued for a specific set of purposes including:

1. ***include preserving public health or public safety or other imperative reasons of over-riding public interest including those of a social or economic nature and beneficial consequences of primary importance for the environment;***
2. scientific and educational purposes,
3. ringing or marking
4. conserving wild animals

Development works fall under the first purpose and Natural England issues bat mitigation licences for developments.

4.2 Evaluation

The following recommendations are provided taking the desk-based assessment and site survey results into account.

Table 5: Evaluation of building on site

Ref	Survey conclusions	Foreseen impacts	Recommendations / Mitigation
B1	<p>A single soprano pipistrelle roost is located on the north-eastern roof pitch. The bat was observed to emerge from an area of roof tiles close to the eaves and east of the chimney stack. As a single emergence was observed, during a full suite of three surveys, the roost is assessed to be a day roost used occasionally by a single male or non-breeding female bat.</p>	<p>As the proposals include the demolition of the building the bat roost will be destroyed. This could result in bats being injured, killed or disturbed.</p>	<p>A European protected species mitigation licence (EPSML) will be required from Natural England prior to the commencement of works, once planning has been granted. As only a low number of common species of bat is present, the site is eligible for a bat mitigation class (low impact) licence.</p> <p>Full details of mitigation and compensation required will be included in the licence application. This will include Pre-works inspection of the known roost locations by the licence named ecologist or their accredited agent immediately prior to the commencement of the destructive search. Ecological supervision of the removal of the hanging tiles by hand and the installation of a Schwegler 2FN (or similar woodcrete) bat box on site prior to the start of work. There will be no restrictions on the timing of the work. Any additional lighting on site will follow Bat Conservation Trust lighting guidelines and will not cast any light on the tree line to the north west, or on to any bat boxes.</p> <p>Detail mitigation required under EPSML:</p> <p>Bat box erected on site prior to commencement of works. These will include two of the following:</p> <ul style="list-style-type: none"> ➤ Schwegler 2FN Bat Box x 2 <p>Bat boxes should be positioned 3-5m above ground level facing in a south/south-westerly direction with a clear flight path to and from the entrance.</p>

			<ul style="list-style-type: none"> • Pre-works inspection of the roost area by the licence Named Ecologist or their Accredited Agent immediately prior to the commencement of the destructive search. • Destructive search via soft stripping by hand of the roof tiles prior to works. • Any bats located during the pre-works inspection and destructive search will be carefully captured by hand and transported to an appropriate bat box by the Licence Named Ecologist or their Accredited Agent. • Permanent replacement roosting provision will be incorporated into the new build. This will include bat tubes and or tiles, in the walls. • The new roof will be lined with Type 1F Felt lining only. Scientific research has shown that Breathable Roof Membranes (BRMs) are harmful to bats with bats becoming entangled in loose fibres resulting in the death of bats. BRMs used in bat roosts can quickly become shredded by the bats claws resulting in a reduced lifespan of the product. There is currently no bat friendly BRM products on the market. For more information visit www.batsandbrms.co.uk. • No post-development monitoring is required for low numbers of common species. Evidence to confirm that the bat compensation measures detailed within the EPSML have been installed will be provided by the Licensee for the Licence Return which will be submitted to Natural England within 14 days of the Licence expiration date. • Lighting will be controlled across the developed site. Research into the effects of artificial lighting on bats has shown that it can impact upon bat
--	--	--	---

			<p>emergence times and lead to a reduced foraging time. As bats are faithful to their roost sites, often returning to the same site for many years, the impact of lighting on emergence times and in turn reduced foraging times can ultimately result in the roosts being abandoned.</p> <ul style="list-style-type: none"> • Key areas of the site which are sensitive to artificial lighting are the site boundaries which consist of tree lines providing foraging and commuting routes for bats. The western tree line was well used. • No lighting will be installed within the tree lined boundaries thereby maintaining the existing dark areas within the developed site for bats. • Low impact lighting strategies will be adopted from the guidance outlined in the new Bats and Lighting Publication produced by the Institution of Lighting Professionals and the Bat Conservation Trust "Guidance Note 08/18 Bats and artificial lighting in the UK Bats and the Built Environment series" publication: <p>http://www.bats.org.uk/news.php/406/new_guidance_on_bats_and_lighting</p> <ul style="list-style-type: none"> • The lighting on the site will: <ul style="list-style-type: none"> - Use narrow spectrum light sources to lower the range of species affected by lighting - Use light sources that emit minimal ultra-violet light - Avoid white and blue wavelengths of the light spectrum to reduce insect attraction and where white light sources are required in order to manage the blue short wave length content they should be of a warm / neutral colour temperature <4,200 kelvin. <p>Not use bare bulbs and any light pointing upwards. The spread of light will be kept in line with or below the horizontal.</p>
--	--	--	--

			<ul style="list-style-type: none">• Light spill will be reduced via the use of low-level lighting used in conjunction with hoods, cowls, louvers and shields. Lights will also be directional to ensure that light is directed to the intended areas only.• External lighting will be positioned below the eaves, be on PIR sensors that are sensitive to large objects only (so that they are not triggered by passing bats), and will be set to the shortest time duration to reduce the amount of time the lights are on.• Wall lights and security lights will be 'dimmable' and set to the lowest light intensity settings. There are several products on the market that allow the control of the light intensity and the duration that the lights are on. All lighting on the developed site will make use of the most up to date technology available. <p>All of the above will ensure that the replacement bat roosts within the developed site will not be affected by any external lighting ensuring their long-term use.</p>

Appendix 1: Survey Plan

Appendix 2: Proposed Site Plan

Appendix 3: Legislation and Planning Policy related to bats

LEGAL PROTECTION

National and European Legislation Afforded to Habitats

International Statutory Designations

New legislation (2020)

The Conservation of Habitats and Species (Amendment) (EU Exit) Regulations 2019 came into force when Britain left the European Union on 31st January 2020. It covered amendments relevant to this survey to:

Wildlife and Countryside Act 1981: England and Wales (x1 amendment)

Conservation of Habitats and Species Regulations 2017 (x29 amendments)

All species of bat are fully protected under ***The Conservation of Habitats and Species Regulations 2017*** through their inclusion on Schedule 2.

Regulation 43: Protection of certain wild animals - offences

(1) A person is guilty of an offence if they:

- (a) Deliberately captures, injures or kills any wild animal of a European protected species,
- (b) Deliberately disturbs wild animals of any such species,
- (c) Deliberately takes or destroys the eggs of such an animal, or
- (d) Damages or destroys a breeding site or resting place of such an animal,

(2) For the purposes of paragraph (1) (b), disturbance of animals includes in particular any disturbance which is likely—

- (a) To impair their ability:
 - (i) To survive, to breed or reproduce, or to rear or nurture their young; or
 - (ii) In the case of animals of a hibernating or migratory species, to hibernate or migrate; or
- (b) To affect significantly the local distribution or abundance of the species to which they belong.

Bats are also protected under the ***Wildlife and Countryside Act 1981 (as amended 01.04.1996)*** through their inclusion on ***Schedule 5***. Under this Act, they are additionally protected from:

- Intentional or reckless disturbance (at any level)
- Intentional or reckless obstruction of access to any place of shelter or protection
- Selling, offering or exposing for sale, possession or transporting for purpose of sale

NATIONAL PLANNING POLICY (ENGLAND)**National Planning Policy Framework 2017**

The National Planning Policy Framework promotes sustainable development. The Framework specifies the need for protection of designated sites and priority habitats and species. An emphasis is also made on the need for ecological infrastructure through protection, restoration and re-creation. The protection and recovery of priority species (considered likely to be those listed as UK Biodiversity Action Plan priority species) is also listed as a requirement of planning policy.

In determining a planning application, planning authorities should aim to conserve and enhance biodiversity by ensuring that: designated sites are protected from harm; there is appropriate mitigation or compensation where significant harm cannot be avoided; opportunities to incorporate biodiversity in and around developments are encouraged; and planning permission is refused for development resulting in the loss or deterioration of irreplaceable habitats including aged or veteran trees and also ancient woodland.

The Natural Environment and Rural Communities Act 2006 and the Biodiversity Duty

Section 40 of the Natural Environment and Rural Communities (NERC) Act 2006, requires all public bodies to have regard to biodiversity conservation when carrying out their functions. This is commonly referred to as the 'biodiversity duty'.

Section 41 of the Act requires the Secretary of State to publish a list of habitats and species which are of 'principal importance for the conservation of biodiversity'. This list is intended to assist decision makers such as public bodies in implementing their duty under Section 40 of the Act. Under the Act these habitats and species are regarded as a material consideration in determining planning applications. A developer must show that their protection has been adequately addressed within a development proposal.

Effect on development works:

A European Protected Species Mitigation (EPSM) Licence issued by Natural England will be required for works likely to affect a bat roost or for operations likely to result in a level of disturbance which might impair their ability to undertake those activities mentioned above (e.g. survive, breed, rear young and hibernate). The licence is to allow derogation from the relevant legislation but also to enable appropriate mitigation measures to be put in place and their efficiency/success to be monitored. The legislation may also be interpreted such that, in certain circumstances, important foraging areas and/or commuting routes can be regarded as being afforded *de facto* protection, for example, where it can be proven that the continued usage of such areas is crucial to maintaining the integrity and long-term viability of a bat roost (Garland & Markham, 2008).

There are 17 species of bat breeding in England and Natural England issues licences under Regulation 55 of the Habitats Regulations to allow you to work within the law.

Licences are issued for specific purposes stated in the Regulations, if the following three tests are met:

- The purpose of the work meets one of those listed in the Habitats Regulations (see below);
- That there is no satisfactory alternative;
- That the action authorised will not be detrimental to the maintenance of the population of the species concerned at a favourable conservation status (FCS) in their natural range

The Habitats Regulations permits licences to be issued for a specific set of purposes including:

- *include preserving public health or public safety or other imperative reasons of over-riding public interest including those of a social or economic nature and beneficial consequences of primary importance for the environment;*
- scientific and educational purposes,
- ringing or marking
- conserving wild animals

Development works fall under the first purpose and Natural England issues bat mitigation licences for developments.
