

Landscape Plan

Planting Layout

The scheme aims to improve the environment of this mews site. Through use of varying textures under foot and new areas of planting the intention is to make the space brighter and tidier for all those who pass through the site.

All existing trees will be retained. As mentioned in the tree report submitted as part of this application, it has been suggested that a number of these trees could benefit from minor intervention, such as raising the crowns or pruning.

There is a planted buffer between the car parking spaces and the fence of at least 500mm, to accommodate climbing plants and 'triangles' of space, widening to 2m at the widest points, created by the angled parking that allow for a variety of plants to be planted, creating varying heights, interest and texture.

The bin store and fencing to the northern edge will have climbers planted to grow upwards to create a green wall.

The two larger terraces will have built in planters. There will be a focus on native planting throughout the planting scheme. Both residential entrances will also have built in planters to either side of them.

Rainwater harvesting will be utilised on the two larger terraces to help provide water for upkeep of plants. There will also be one adjacent to Block 2 to provide water towards the upkeep of the communal planting.

As shown in the drainage strategy submitted as part of this planning application, SUDS technology and storage crates will be utilised to improve drainage across the site.
