1 EXECUTIVE SUMMARY

1.1 EXECUTIVE SUMMARY

The proposed scheme has been developed alongside GIA in order to optimise the daylight and sunlight amenities for future occupants.

This has been achieved through an iterative process of testing, feedback and design.

Living areas have been furnished, wherever possible, with secondary aspects and windows have been optimised to balance daylight ingress while avoiding overheating and preserving privacy.

Balconies have been offered with every unit and their location carefully considered in order to minimise their impact upon the windows beneath them.

The resulting scheme performs generally well in daylight terms, with 78% of all habitable rooms meeting or exceeding the target levels for Average Daylight Factor (ADF), the most complete among daylight tests.

88% of all rooms with an expectation of sunlight meet or exceed BRE's recommendation for Probable Sunlight Hours (PSH) and finally, the main open space at the heart of the scheme, exceeds targets with 60% of its area seeing 2 hours or more sunlight on the 21st of March.

We can therefore conclude that the scheme makes the most of the daylight and sunlight available to site and delivers a well rounded and carefully considered scheme in relation to daylight and sunlight amenity.

Further detail is provided in the conclusions section of this report.

2 INTRODUCTION

2.1 INTRODUCTION AND OBJECTIVE

GIA has been instructed to provide a report upon the potential availability of Daylight and Sunlight to the proposed accommodation within the residential scheme prepared by BPTW. GIA was specifically instructed to carry out the following:

- To create a 3D computer model of the proposal based upon drawings prepared by BPTW.
- Carry out a daylight assessment using the methodologies set out in the BRE guidance for Average Daylight Factor, No-Sky Line and Room Depth Criterion.
- Carry out a sunlight assessment using the methodologies set out in the BRE guidance for Annual Probable Sunlight Hours (APSH) to the fenestration facing within 90° of due south.
- Carry out an overshadowing assessment using the methodology set out in the BRE guidance for Sun Hours On Ground (SHOG) for all relevant amenity areas.
- Prepare a report setting out the analysis and our findings.

3 BRE GUIDELINES

The Building Research Establishment (BRE) have set out in their handbook 'Site Layout Planning for Daylight and Sunlight a Guide to Good Practice (2011)', guidelines and methodology for the measurement and assessment of daylight and sunlight within proposed buildings.

The guide also provides advice on site layout planning to determine the quality of daylight and sunlight within open spaces between buildings.

It is important to note, however, that this document is a guide and states that its aim *"is to help rather than constrain the designer"*.

The document provides advice, but also clearly states that it *"is not mandatory and this document should not be seen as an instrument of planning policy."* The report also acknowledges in its introduction that *"in special circumstances the developer or planning authority may wish to use different target values. For example, in a historic city centre a higher degree of obstruction may be unavoidable if new developments are to match the height and proportions of existing buildings."*

It is an inevitable consequence of the built up urban environment that daylight and sunlight will be more limited in these areas. It is well acknowledged that in such situations there may be many other conflicting and potentially more important planning and urban design matters to consider other than just the provision of ideal levels of daylight and sunlight.

3.1 DAYLIGHT

The BRE set out various methods for assessing the daylight within a proposed building within section 2.1 and Appendix C of the handbook. These are summarised below.

Vertical Sky Component (VSC)

This method of assessment can be undertaken using a skylight indicator or a Waldram diagram. It measures from a single point, at the centre of the window (if known at the early design stage), the quantum of sky visible taking into account all external obstructions. Whilst these obstructions can be either other buildings or the general landscape, trees are usually ignored unless they form a continuous or dense belt of obstruction.

The VSC method is a useful 'rule of thumb' but has some significant limitations in determining the true quality of daylight within a proposed building. It does not take into account the size of the window, any reflected light off external obstructions, any reflected light within the room, or the use to which that room is put. Appendix C of the guide goes into more detail on these matters and sets forward alternative methods for assessment to overcome these limitations.

Appendix C of the BRE guide: Interior Daylighting Recommendations, states:

"The British Standard Code of practice for daylighting (BS 8206-2) and the CIBSE Lighting Guide LG 10 Daylighting and window design contain advice and guidance on interior daylighting. The guidance contained in this publication (BR 209) is intended to be used with BS 8206-2 and LG 10. Both these publications refer to BR 209.

For skylight BS 8206-2 and LG 10 put forward three main criteria, based on average daylight factor (ADF); room depth; and the position of the no sky line."

These assessments are set out below.

Average Daylight Factor (ADF)

"If a predominantly daylight appearance is required, then the ADF should be 5% or more if there is no supplementary electric lighting, or 2% or more if supplementary electric lighting is provided. There are additional recommendations for dwellings of 2% for kitchens, 1.5% for living rooms and 1% for bedrooms.

These additional recommendations are minimum values of ADF which should be attained even if a predominantly daylight appearance is not achievable."

This method of assessment takes into account the total glazed area to the room, the transmittance quality of the glazing proposed, the total area of the room surfaces including ceilings and floors, and the internal average reflectance for the room being assessed. The method also takes into account the Vertical Sky Component and the quantum of reflected light off external surfaces.

This is, therefore, a significantly more detailed method of assessment than the Vertical Sky Component method set out above.

Room Depth Criterion (RDC)

Where it has access to daylight from windows in one wall only, the depth of a room can become a factor in determining the quantity of light within it. The BRE guidance provides a simple method for examining the ratio of room depth to window area. However, whilst it does take into account internal surface reflections, this method also has significant limitations in that it does not take into account any obstructions outside the window and therefore draws no input from the quantity of light entering the room.

No Sky Line (NSL)

This third method of assessment is a simple test to establish where within the proposed room the sky will be visible through the windows, taking into account external obstructions. The assessment is undertaken at working plane height (850mm above floor level) and the method of calculation is set out in Appendix D of the BRE handbook.

Appendix C of the BRE handbook states *"If a significant area of the working plane (normally more than 20%) lies beyond the no sky line (ie it receives no direct skylight) then the distribution of daylight in the room will look poor and supplementary electric lighting will be required."* To guarantee a satisfactory daylight uniformity, the area which does not receive direct skylight should not exceed 20% of the floor area, as quantified in the BS 8206 Part2 2008.

Summary

The Average Daylight Factor gives a more detailed assessment of the daylight within a room and takes into account the highest number of factors in establishing a quantitative output.

However, the conclusion of Appendix C of the BRE guide states:

"[All three of] the criteria need to be satisfied if the whole of the room is to look adequately daylight. Even if the amount of daylight in a room (given by the Average Daylight Factor) is sufficient, the overall daylight appearance will be impaired if its distribution is poor."

In most urban areas it is important to recognise that the distribution of daylight within a room may be difficult to achieve, given the built up nature of the environment. Consequently, most local authorities seek to ensure that there is sufficient daylight within the room as determined by the Average Daylight Factor calculation. However, the additional recommendations of the BRE and British Standard for residential accommodation, set out above, ought not to be overlooked.

3.2 SUNLIGHT

The BRE provide guidance in respect of sunlight quality for new developments within section 3.1 of the handbook. It is generally acknowledged that the presence of sunlight is more significant in residential accommodation than it is in commercial properties, and this is reflected in the BRE document.

It states, *“in housing, the main requirement for sunlight is in living rooms, where it is valued at any time of the day, but especially in the afternoon. Sunlight is also required in conservatories. It is viewed as less important in bedrooms and in kitchens where people prefer it in the morning rather than the afternoon.”*

The BRE guide considers the critical aspects of orientation and overshadowing in determining the availability of sunlight at a proposed development site.

The guide proposes minimizing the number of dwellings whose living room face solely north unless there is some compensating factor such as an appealing view to the north, and it suggests a number of techniques to do so. Further more, it discusses massing solutions with a sensitive approach to overshadowing, so as to maximize access to sunlight.

At the same time it acknowledges that the site’s existing urban environment may impose orientation or overshadowing constraints which may not be possible to overcome.

To quantify sunlight access for interiors where sunlight is expected, it refers to the BS 82606-2 criterion of Annual Probable Sunlight Hours. APSH is defined as *“the total number of hours in the year that the sun is expected to shine on unobstructed ground, allowing for average levels of cloudiness at the location in question.”* In line with the recommendation, APSH is measured from a point on the inside face of the window, should the locations have been decided. If these are unknown, sunlight availability is checked at points 1.6m above the ground or the lowest storey level on each main window wall, and no more than 5m apart. If a room has multiple windows on the same wall or on adjacent walls, the highest value of APSH should be taken into account. If a room has two windows on opposite walls, the APSH for each can be added together.

The summary of section 3.1 of the guide states as follows:

“In general, a dwelling or non-domestic building which has a particular requirement for sunlight, will appear reasonably sunlit provided that:

- *At least one main window faces within 90 degrees of due south, and*
- *The centre of at least one window to a main living room can receive 25% of annual probable sunlight hours, including at least 5% of annual probable sunlight hours in the winter months between 21 September and 21 March. ”*

In paragraph 3.1.11 the BRE guidance suggests that if a room faces significantly North of due East or West it is unlikely to meet the recommended levels proposed by the BS 8206-2. As such, it is clear that only windows facing within 90 degrees of due South can be assessed using this methodology.

It is also worth noting how paragraph 5.3 of the BS 8206-2 suggests that with regards to sunlight duration *“the degree of satisfaction is related to the expectation of sunlight. If a room is necessarily north facing or if the building is in a densely-built urban area, the absence of sunlight is more acceptable than when its exclusion seems arbitrary”.*

3.3 OVERSHADOWING

The BRE guidance in respect of overshadowing of amenity spaces is set out in section 3.3 of the handbook. Here it states as follows:

“Sunlight in the spaces between buildings has an important impact on the overall appearance and ambiance of a development. It is valuable for a number of reasons, to:

- *provide attractive sunlit views (all year)*
- *make outdoor activities, like sitting out and children’s play more pleasant (mainly warmer months)*
- *encourage plant growth (mainly spring and summer)*
- *dry out the ground, reducing moss and slime (mainly in colder months)*
- *melt frost, ice and snow (in winter)*
- *dry clothes (all year)”*

Again, it must be acknowledged that in urban areas the availability of sunlight on the ground is a factor which is significantly controlled by the existing urban fabric around the site in question and so may have very little to do with the form of the development itself. Likewise there may be many other urban design, planning and site constraints which determine and run contrary to the best form, siting and location of a proposed development in terms of availability of sun on the ground.

The summary of section 3.3 of the guide states as follows:

“3. 3 .17 It is recommended that for it to appear adequately sunlit throughout the year, at least half of a garden or amenity area should receive at least two hours of sunlight on 21 March. If as a result of new development an existing garden or amenity area does not meet the above, and the area which can receive two hours of sun on 21 March is less than 0.8 times its former value, then the loss of sunlight is likely to be noticeable. If a detailed calculation cannot be carried out, it is recommended that the centre of the area should receive at least two hours of sunlight on 21 March.”

3.4 FURTHER RELEVANT INFORMATION

Further information can be found in The Daylight in Urban Areas Design Guide (Energy Saving Trust CE257, 2007) which provides the following recommendation with regards to VSC levels in urban areas:

“If ‘theta’ (Visible sky angle) is greater than 65° (obstruction angle less than 25° or VSC at least 27 percent) conventional window design will usually give reasonable results.

If ‘theta’ is between 45° and 65° (obstruction angle between 25° and 45°, VSC between 15 and 27 percent), special measures such as larger windows and changes to room layout are usually needed to provide adequate daylight.

If ‘theta’ is between 25° and 45° (obstruction angle between 45° and 65°, VSC from 5 to 15 percent), it is very difficult to provide adequate daylight unless very large windows are used.

If ‘theta’ is less than 25° (obstruction angle more than 65°, VSC less than 5 percent) it is often impossible to achieve reasonable daylight, even if the whole window wall is glazed.”

4 METHODOLOGY

In order to undertake the daylight, sunlight and overshadowing assessments set out in the later pages, we have prepared a three dimensional computer model and used specialist lighting simulation software.

The three dimensional representation of the proposed development has been modelled using the scheme drawings provided to us by BPTW. This has been placed in the context of its surrounding buildings which have been modelled from survey information, photogrammetry, OS and site photographs. This allows for a precise model, which in turn ensures that analysis accurately represents the amount of daylight and sunlight available to the building facades, internal and external spaces, considering all of the surrounding obstructions and orientation.

4.1 SIMULATION ASSUMPTIONS

Where no values for reflectance, transmittance and maintenance factor were specified by the designer the following values from *BS 8206-2:2008, Annex A, tables A.1-A.6* were used for the calculation of Average Daylight Factor values. These values are shown in Table 1.

Table 01: Typical reflectance, transmittance and maintenance factors

| REFLECTANCE VALUES: | | MAINTENANCE FACTORS: GLAZING TYPE | | | | | | TV (Normal) | A.3 | A.4 | A.5 | A.6 | TV (Total) |
|---|------|--|------|---|---|---|-----|----------------|-----|-----|-----|-----|---------------|
| Surrounding | 0.2 | Triple Low-E (frames modelled) | 0.63 | 8 | 1 | 1 | 1 | 0.58 | | | | | |
| Pavement | 0.2 | Triple Low-E (frames not modelled) | 0.63 | 8 | 1 | 1 | 0.8 | 0.46 | | | | | |

| | | Double Translucent Low-E (horizontal, frames not modelled) | 0.74 | 8 | 3 | 1 | 0.8 | 0.45 | | | | | |

5 CONCLUSIONS

5.1 SUMMARY OF CONCLUSIONS

The proposed masterplan at Richmond College has been developed taking daylight and sunlight into account from the start.

Through an iterative process of testing, feedback and design, daylight and sunlight have been optimised throughout the scheme.

Living areas have been furnished wherever possible with secondary aspects and fenestration for instance, and windows have been optimised to balance daylight ingress while avoiding overheating and preserving privacy.

Balconies have been offered with every unit and their location carefully considered in order to minimise their impact upon the windows beneath them.

The resulting scheme performs generally well in daylight terms, very well in sunlight terms and exceeds the recommendations for outdoor amenity in relation to its exposure to sunlight.

We can therefore conclude that the scheme makes the most of the daylight and sunlight available to site and delivers a well rounded and carefully considered scheme in relation to daylight and sunlight amenity.

5.2 CONCLUSIONS ON DAYLIGHT

All habitable rooms within the proposed scheme have been tested for Average Daylight Factor (ADF), No-sky line (NSL) and Room Depth Criterion (RDC), in accordance to BRE's recommendations.

The results can be found on pages 16-97 of this report alongside the floor plans and a key illustrating the location of individual tested blocks within the masterplan.

Overall 78% of the proposed habitable rooms will meet or exceed the target levels, which is a good results for a scheme of this size and nature in London.

Moreover, more than 83% of habitable rooms will have a view of the sky at desk height, in accordance to the NSL test, and all rooms meet the RDC criterion where this is applicable.

Combined with a very high compliance level in terms of sunlight and overshadowing tests, the proposed development is of high quality overall.

Where there are rooms falling short of the ADF or NSL guidance, the main reason is the presence of generous balconies which offer future occupants private open space. This is visible, in example, for rooms such as no. 5 and 15 where the presence of a balcony above the main living areas' windows reduces the direct view of the sky, and with it, the quantum of light entering the rooms.

Blocks B5 and B6 for instance, perform generally very well, with the exception of a few rooms, where the presence of balconies and access deck result in lower daylight levels indoors. These particular units (including rooms no. 273 and 284 in example), benefit from dual aspects, however, owing to the presence of exterior private amenity, will receive less daylight than otherwise possible. This is a conscious trade off of amenities which occurs in a small number of units within these two blocks.

All the main rooms within the town houses see levels of internal daylight and sunlight that meet or exceed the recommended levels. This is with the only exception of a few third bedrooms, which however fall only marginally short by 0.1% ADF.

5.3 CONCLUSIONS ON SUNLIGHT

All main living room windows with an expectation of sunlight have been tested for Probable Sunlight Hours (PSH) as described within the BRE Guidance.

The results can be found alongside the daylight ones in the tables provided throughout this report.

Overall circa 88% of all tested windows receive good levels of sunlight, which is a very high score considered the presence of balconies throughout the scheme.

Those windows falling short, do so typically because of the balconies, which intercept the sun rays before they can reach the fenestration beneath them. However, this is a typical trade off of amenities (private open spaces v daylight and sunlight), and future occupants will still be able to enjoy direct access to sunlight through the use of the balconies.

5.4 CONCLUSIONS ON OVERSHADOWING

The main communal open space at the centre of the development has been tested for Sun Hours on Ground (SHOG) in accordance with BRE's Guidance.

Th results are presented on page 98 of this report.

60% of the area receives at least 2 hours in the sun on the 21st of March where 50% is the target level, and will therefore offer future occupants a well sunlit open space.

Moreover, pages 99 and 100 illustrate the number of hours received across the communal area on the 21st of March and June respectively, providing a further layer of information about the area's performance during the summer time.

It can therefore be concluded that the scheme performs well overall considering all areas related to daylight, sunlight and overshadowing amenity.

7 INTERPRETATION OF RESULTS

KEY TO UNDERSTANDING THE TABLES - DAYLIGHT

DAYLIGHT QUANTUM

Average Daylight Factor (ADF)
 Refers to the average percentage of daylight flux in a room against an external unobstructed plane.
 BRE recommends ADF levels of 2% for rooms with kitchens (including LKDs and studios with kitchens), 1.5% for living rooms and studies, and 1% for bedrooms.

| ROOM REF. | ROOM USE | DAYLIGHT QUANTUM | | | SUNLIGHT QUANTUM (PROBABLE SUNLIGHT HOURS) | |
|--------------------------|-------------|------------------|---------|-----|--|--------|
| | | ADF (%) | NSL (%) | RDC | ANNUAL | WINTER |
| Building C - SIXTH FLOOR | | | | | | |
| 686 | L/K/D | 2.8 | 99 | N/A | | |
| 687 | L/K/D | 2.5 | 100 | N/A | 78 | 27 |
| 688 | Bedroom | 1.1 | 90 | MET | | |
| 689 | Bedroom | 1.4 | 87 | MET | | |
| 690 | Bedroom | 1.4 | 89 | MET | | |
| 691 | Bedroom | 2 | 85 | N/A | | |
| 692 | Bedroom | 1.6 | 82 | MET | | |
| 693 | Bedroom | 1.4 | 95 | MET | | |
| 694 | Bedroom | 1.6 | 98 | MET | | |
| 695 | Bedroom | 2.2 | 93 | N/A | | |
| 696 | Living Room | 2.6 | 100 | N/A | 56 | 24 |
| 697 | Bedroom | 2.5 | 100 | N/A | | |
| 698 | Bedroom | 2.3 | 97 | MET | | |
| 699 | L/K/D | 1.3 | 95 | MET | 57 | 28 |
| 700 | Living Room | 1.8 | 96 | N/A | 64 | 27 |
| 701 | Bedroom | 1.4 | 98 | MET | | |
| 702 | Living Room | 1.2 | 96 | MET | 39 | 14 |

DAYLIGHT DISTRIBUTION

No-SkyLine (NSL)
 Refers to the percentage of the room with a view of the sky from a working plane at desk height.
 BRE recommends the NSL to be at least 80% for the room to guarantee satisfactory daylight uniformity.

Room Depth Criterion (RDC)
 Defines adequate room proportions that enable good distribution of light. It applies to rooms lit by windows in one wall only.
 MET : The room meets the Room Depth criterion
 NOT MET: The room does not meet BRE's RDC
 N/A (Not Applicable): The room is not lit by windows in one wall only, and cannot be assessed by BRE's RDC

KEY TO UNDERSTANDING THE TABLES - SUNLIGHT

| 701 | Bedroom | 1.4 | 98 | MET | | |
| 702 | Living Room | 1.2 | 96 | MET | 39 | 14 |

SUNLIGHT QUANTUM

Probable Sunlight Hours (PSH)

Refers to the average of hours during a year in which a surface receives direct sunlight (%).

BRE states that sunlight is most appreciated in living areas and the greatest expectation of sunlight is within south facing rooms. PSH assessments therefore consider all of the living rooms with a main window facing within 90 degrees of due south.

Annual Probable Sunlight Hours (APSH)

BRE recommends at least 25% of Annual Probable Sunlight Hours for rooms where sunlight is expected.

Winter Probable Sunlight Hours (WPSH)

BRE recommends at least 5% of Winter Probable Sunlight Hours for rooms where sunlight is expected.
