### 1. Introduction

#### 1.1. Instruction

1.1.1. We are instructed by Cunnane Town Planning to:

- Undertake an Arboricultural Survey at The Rose of York, Petersham Road and assess all trees potentially within influencing distance of proposed development within the site.
- Plot the trees on a Tree Constraints Plan and record the data in a Tree Data Schedule.
- Provide an overview of the site and any management recommendations.
- Determine if any of the trees are growing within a conservation area or are protected by a tree preservation order.
- Provide guidance for architects or developers to enable them to understand and design within the existing tree constraints.
- Assess the potential impact of the development proposals and provide guidance as to appropriate mitigation measures.
- Produce an Arboricultural Impact Assessment for submission to the local authority once the design has been finalised.
- Produce a Tree Protection Plan and Arboricultural Method Statement specifying how
  the retained trees shall be protected from inadvertent damage by demolition or
  construction activity.

### 1.2. Scope and Purpose of the Report

- 1.2.1. This report is designed to accompany a planning application for development proposals at the above site. Its purpose is to assist and inform the design and planning process. It is produced according to the guidance and recommendations within BS 5837: 2012 Trees in Relation to Design, Demolition and Construction.
- 1.2.2. The accompanying Arboricultural Method Statement specifies the principles to be adopted during construction and demolition that will minimise any impacts on trees. However, specific construction activities proposed within Root Protection Areas may need to be agreed in more detail if requested by the local authority at the reserved matters stage (for an outline planning applications) or via planning conditions.

#### 1.3. References

1.3.1. We have liaised with the project architect our client and studied topographical surveys and projected ground levels to attain an adequate understanding of the project to enable us to carry out an accurate assessment of the proposals and to specify suitable tree protection measures.

#### 1.4. Survey Details and Findings

- 1.4.1. A visual ground level inspection of all trees was undertaken on the 28<sup>th</sup> May 2019 by Joe Taylor. No climbed inspections or specialist decay detection were undertaken. Details of how the survey was undertaken can be found in Appendix 1.
- 1.4.2. The findings of the survey are presented in The Tree Data Schedule which is provided as a separate document as well as being appended to the end of this document within Appendix 6. The vegetation is further discussed in Section 3.

Crown Ref: 010313 Site: The Rose Of York, Petersham Road, Richmond

Author: Joe Taylor Date: 27<sup>th</sup> July 2021

1.4.3. The Schedule includes scaled tree images based on measurements recorded for stem diameter, crown spread, crown height and overall height. Their purpose is to indicate, at a glance, the relative dimensions of each tree.

1.4.4. A definition of the Retention Categories can be found in Appendix 1. All other terms used within the Tree Data Schedule are defined and explained in Appendix 2. A more detailed description of the survey method is detailed in Appendix 3.

#### 1.5. Drawings

- 1.5.1. The tree locations shown on the accompanying plans which are reproduced in Appendix 6 are based on a measured plan of the site supplied to Crown Tree Consultancy. This plan had the tree positions already plotted. Where applicable, additional trees have been plotted by us according to measurements taken on site.
- 1.5.2. The *Tree Constraints Plan* shows the existing layout. For each tree the stem location is indicated and scaled according to its diameter, the canopy is indicated according to measurements taken along the four cardinal points of the compass. Root protection areas (RPAs) are indicated which are calculated according to the guidelines within BS 5837 (2012).
- 1.5.3. Where appropriate, the shapes of the RPAs have been amended to reflect actual site conditions or where trees have been heavily pruned. The 'original' RPAs are indicated as a dashed line whereas the amended RPAs are indicated as a solid line.
- 1.5.4. The *Impact Assessment Plan* indicates the tree constraints with the proposals overlaid. Where applicable, this plan shows where works are proposed in Root Protection Areas and which trees are to be pruned or removed. This plan accompanies the Impact Assessment which is to be found in Section 4.
- 1.5.5. The *Tree Protection Plan* shows the protection measures that are to be installed during the construction phase. This plan forms part of the accompanying Arboricultural Method Statement which is also appended to this report (see Appendix 6).

#### 1.6. Author

1.6.1. This report was compiled by Joe Taylor - FdSc (Arboriculture), M. Arbor A. Details of the author's experience that qualify him to produce such a report are detailed in Appendix 4.

Crown Ref: 010313 Site: The Rose Of York, Petersham Road, Richmond

Author: Joe Taylor Date: 27<sup>th</sup> July 2021

### 2. Site Overview

#### 2.1. Brief Description

2.1.1. The Rose of York is a detached public house and hotel, located approximately 0.3km from Richmond Park.

- 2.1.2. Landscaped gardens exist to the north-east and south-east of the pub with extensive woodland beyond its south-eastern boundary. Petersham Road runs along the east of the property and the pub car park is located to the north-west.
- 2.1.3. The trees surveyed include, three trees which grow within the landscaped gardens to the south-east (T12 T14), numerous trees along the woodland boundary (T17 G21) and numerous trees which grow adjacent to the car park (T1 T11).
- 2.1.4. The Tree Constraints Plan and Tree Data Schedule (see Appendix 6) should be referred to for descriptions and locations of all trees.

#### 2.2. Coordinates

2.2.1. The site coordinates are 51°27'2.33"N o°18'0.43"W and the altitude is approximately 9m above sea level<sup>1</sup>.

### 2.3. Survey Extent

2.3.1. We surveyed the entire curtilage of the property along with all trees beyond its boundaries which could potentially be affected by any development within it. The area indicated below<sup>2</sup> shows the extent of the survey.

<sup>&</sup>lt;sup>1</sup> To access satellite imagery and street views of the site these co-ordinates may be entered into: <a href="http://maps.google.co.uk/">http://maps.google.co.uk/</a>

\_

<sup>&</sup>lt;sup>2</sup> Image taken from Google Earth and may not be current

Crown Ref: 010313 Site: The Rose Of York, Petersham Road, Richmond

Author: Joe Taylor Date: 27<sup>th</sup> July 2021

### 3. Vegetation Overview (independent of proposals)

This section summarises all the recommendations within the Tree Data Schedule regardless of whether trees are to be retained, felled or pruned to facilitate the proposed development. It does not specify works that may be required to facilitate the development proposals. The protection status of the trees is also reported in this section.

### 3.1. Preliminary Management Recommendations

- 3.1.1. The following recommendations are made in order to maintain the trees in an acceptable condition:
- 3.1.2. To is potentially hazardous and will require removal in order to prevent possible damage due to tree or limb failure. This should be prioritised as indicated on the Tree Data Schedule.
- 3.1.3. The is in an acceptable condition at present but will require works in order to prevent future defects from developing. Such work is of a relatively low priority.
- 3.1.4. T3 is considered to be in an acceptable condition at present but has defects which require monitoring.
- 3.1.5. Some trees could not be fully inspected due to the presence of dense ivy or undergrowth. It is recommended that the ivy or undergrowth is removed so that the trees may be re-inspected. Trees included are T8 and T10.
- 3.1.6. All other trees were deemed to be in an acceptable condition.

### 3.2. Work Priority and Future Inspections

3.2.1. The table below suggests a schedule for completing the works recommended in the Tree Data Schedule based on the perceived risk:

Work Priority	Definition	Tree Number
Urgent	As soon as possible	None
Very High	Within 1 Month	None
High	Within 3 Months	None
Moderate	Within 1 year	T8, T10
Low	Within 3 years	T3, T9

3.2.2. The table below suggests a schedule of future inspections based on the condition and location of each tree:

Inspection Frequency (years)	Tree Number
0.5	None
1	T8, T10
1.5	Т3
3	All other trees

3.2.3. The trees should be inspected sooner if there is a noticeable decline in their condition, or following extreme weather events.

Crown Ref: 010313 Site: The Rose Of York, Petersham Road, Richmond

Author: Joe Taylor Date: 27<sup>th</sup> July 2021

### 3.3. Tree Protection Status – Site Specific

- 3.3.1. On 29<sup>th</sup> May 2019, we were informed by London Borough of Richmond that:
  - The site is within the Petersham Conservation Area.
  - There are no tree preservation orders affecting trees within the site.
  - There are no tree preservation orders immediately adjacent to the site.

#### 3.4. Tree Protection – General Notes

- 3.4.1. Heavy fines exist for carrying out unauthorised works to protected trees so we advise that further checks are made before any tree-works are undertaken.
- 3.4.2. Where the works are proposed for reasons of safety or ill health, a report from a suitably qualified arborist will usually be required. Trees that are dead or imminently dangerous are technically exempt from protection, as are dead branches. If the tree work is not urgently necessary however, at least five working days notice of intention should be given to the local authority. In any case in would be prudent to take photographs before undertaking works without prior consent being granted. Unauthorised works to protected trees may result in a criminal prosecution and a large fine (unlimited).
- 3.4.3. Where trees are located in a conservation area (but not protected by a TPO), works are not permitted without first giving the local authority 6 weeks' notice of intention. During this time the local authority may elect to create a tree preservation order or to inform the applicant that they have no objection to the proposed works. If the local authority does not respond within 6 weeks, then the intended work may be undertaken. Note: the local authority cannot refuse consent for works to trees within a conservation area; they may only create a tree preservation order if they wish to have further control over what works are undertaken.
- 3.4.4. Where planning permission is granted and tree works have been approved as part of the planning consent, no further application is required in respect of protected trees and no further notice is required in respect of trees within a conservation area.

Author: Joe Taylor Date: 27<sup>th</sup> July 2021

### 4. Arboricultural Impact Assessment

#### 4.1. Overview

- 4.1.1. It is proposed to extend the existing building to the northeast and the southeast. The northwest extension shall extend into and cover the same footprint of an existing underground car park. The existing layout is indicated in black and the footprint of the proposed layout is indicated in pale green, as indicated on the plans in Appendix 6.
- 4.1.2. Existing vehicular access from Petersham Road shall be maintained and the existing car park is to be extended.
- 4.1.1. The table below summarises the potential impact on trees due to various activities.

Activity	Trees Potentially Affected
Tree Removal: Retention Category A	None
Tree Removal: Retention Category B	None
Tree Removal: Retention Category C	T12, T13 and T14
Tree Removal: Retention Category U	None
Tree Pruning	T18, T20 and G21 (2 trees)
RPA: Building Foundations	None
RPA: Wall Foundations	T7, T15 and T18
RPA: Bike Store Foundations	T17
RPA: Reconstruction of Existing Retaining Wall	T4, T5, T8 and T10
RPA: New Hard Surface	T10
RPA: Replace Existing Hard Surface	None
RPA: Underground Services	None Anticipated
RPA: Change of Ground Levels	T10
RPA: Soil Compaction	Trees adjacent the construction area (preventable by installing tree protection measures)

- 4.1.2. Other potentially damaging activities often associated with construction sites include demolition or the careless use of plant machinery, hazardous materials, or fires. All of the above potential impacts are considered in detail throughout this section.
- 4.1.3. The accompanying Arboricultural Method Statement (duplicated in Appendix 6) specifies the measures proposed to minimise all possible potential risks of damage to the retained trees.

#### 4.2. Tree Removal

- 4.2.1. All trees to be removed are indicated on the Tree Removal Plan and are listed below:
  - Retention Category A: Our survey did not identify any Retention Category A trees.
  - Retention Category B: It is proposed to retain all Retention Category B trees.
  - **Retention Category C:** It is proposed to remove the following Retention Category C trees: T12, T13 and T14. These trees are located so close to the new extension and landscaping alterations, that their retention is not practical.

Crown Ref: 010313 Site: The Rose Of York, Petersham Road, Richmond

Author: Joe Taylor Date: 27<sup>th</sup> July 2021

These are relatively small trees (maximum height 7m) and are set back more than 13m from any public vantage points. Consequently, they are not considered to have a particularly high amenity value and their removal shall not have a major impact on the visual amenity of the locality.

Retention Category U: It is not necessary to remove any Retention Category U trees
to facilitate the proposal. However, it is proposed to remove T9 due to its poor
condition.

Trees within this category are in such poor condition that they should be removed regardless of development proposals. Consequently, the removal of Category U trees is not considered to be a direct impact of the development.

4.2.2. Details specific to each tree can also be found in the Tree Data Schedule.

#### 4.3. Mitigation Planting

4.3.1. There is scope for new planting to mitigate against tree loss. I understand that it is proposed to plant several new trees as part of a post development landscaping scheme.

#### 4.4. Impact on Tree Canopies

- 4.4.1. It is proposed to prune back the branches of T18, T20 and G21 (2 trees) that are growing towards the proposed extension, in order to create a clearance distance of 2.5m.
- 4.4.2. The proposed pruning should be carried out by a competent arborist working to BS 3998 (2010) guidelines. All pruning cuts shall be made close to the branch collar or a secondary growth point wherever possible.
- 4.4.3. All other tree canopies shall be unaffected by the proposals.

#### 4.5. Impact on Tree Roots

#### 4.5.1. **Building Foundations:**

4.5.2. No building foundations are proposed within the Root Protection Area of any retained tree. Consequently, no restrictions on foundation design or implementation are considered necessary from an arboricultural perspective.

#### 4.5.3. Wall Foundations:

- 4.5.4. Wall foundations are proposed within the theoretical Root Protection Area of T7, T15 and T18. In order to ensure minimal impact on tree roots, it is proposed to install the wall in a sympathetic manner. The following restrictions are proposed:
  - Only hand tools shall be used during the excavation.
  - If roots in excess of 50mm diameter are encountered, they shall be retained intact and the foundations designed accordingly. If roots in excess of 25mm are encountered, the majority shall be retained intact. A shallow beam shall be incorporated into the foundation design. This shall span over the larger roots, enabling them to be retained.

#### 4.5.5. **Bike Store Foundations:**

4.5.6. A new bike store is proposed over the Root Protection Area of T7, within an existing planting bed. In order to ensure minimal impact on T17, it is proposed to remove the existing planting bed in a sympathetic manner and found the bike store on a ground bearing concrete slab. The existing panting bed shall be removed, and ground levels lowered, using hand tools only. Excavation shall also not extend any closer to T17 than is absolutely necessary. Once ground levels within the planting bed marry up to ground

Crown Ref: 010313 Site: The Rose Of York, Petersham Road, Richmond

Author: Joe Taylor Date: 27<sup>th</sup> July 2021

levels surrounding the planting bed, a ground bearing concrete slab shall be laid onto the ground which the bike store shall be founded on.

#### 4.5.7. **New Surfaces:**

4.5.8. The Impact Assessment Plan indicates where it is proposed to install a new car parking surface over the Root Protection Area of T10. However, it is also proposed to lower ground levels in this area which shall require the severance of any roots encountered. Consequently, there shall be no restrictions on the installation of the new surface.

#### 4.5.9. Changes in Ground Levels:

4.5.10. It is proposed to lower ground levels within a small portion of the Root Protection Area of T10, in order to facilitate the new car parking space and retaining wall. Such a small portion of the RPA shall be affected that the potential impact is considered to be negligible and within tolerable limits. However, in order to minimise the potential impact of the excavation on the RPA, is it proposed to excavate in a manner that does not disturb any of the soils beyond the footprint of the new retaining wall. An example of this could be piling or pinning.

#### 4.5.11. Reconstruction of Existing Retaining Wall:

4.5.12. It is proposed to rebuild the retaining wall which surrounds the existing car park. This shall be required within the Root Protection Areas of T4, T5, T8 and T10. In order to minimise the potential impact of the excavation on the RPAs, is it proposed to excavate in a manner that does not disturb any of the soils beyond the footprint of the new retaining wall. An example of this could be piling or pinning.

#### 4.5.13. Underground Services:

4.5.14. No underground services should be installed through any Root Protection Area without consulting the project arborist and if necessary, gaining approval from the local authority.

#### 4.5.15. **Soil Compaction:**

4.5.16. The majority of tree roots lie within the upper soil horizons. This is because the availability of oxygen decreases with depth and roots need to breathe to stay alive. In addition, nutrients are more readily available in the form of organic matter close to the soil surface.

- 4.5.17. Healthy soils contain about 25% air space between solid particles. Increased loading of the soils caused by construction activity causes air to be squeezed out as the soil becomes compacted preventing roots from breathing. Even an increase in pedestrian activity may cause some soil compaction.
- 4.5.18. It is important therefore that ground compaction and soil disturbance over Root Protection Areas should be avoided during the construction phase. This may be done by installing protective fencing and ground protection measures as recommended within the accompanying Arboricultural Method Statement. These measures should be approved and conditioned by the local authority.

#### 4.6. Demolition Activities

4.6.1. The tree protection measures specified within the accompanying Arboricultural Method Statement should be installed prior to the commencement of all demolition activities (including soil stripping) to prevent any detrimental impact on tree health. Where this is not practicable, demolition of structures within Construction Exclusion Zones shall be undertaken very early on in the demolition phase and the protective barriers installed immediately thereafter.

Crown Ref: 010313 Site: The Rose Of York, Petersham Road, Richmond

Author: Joe Taylor Date: 27<sup>th</sup> July 2021

#### 4.7. Hazardous Materials

4.7.1. All hazardous materials (including cement and petrochemical products) will need to be controlled according to COSHH regulations in order to ensure there is no detrimental impact on tree health. Provision shall need to be made to ensure that cement and cement run-off are contained outside of all Root Protection Areas.

#### 4.8. Cabins and Site Facilities

- 4.8.1. Consideration should be given to the location of any site welfare facilities in terms of potential impact on trees. Where it is proposed to install cabins or site facilities in Root Protection Areas, the project arborist should be consulted and approval obtained from the local authority.
- 4.8.2. Where it is proposed to amend any boundary features over RPAs, the project arborist should be consulted and if necessary, approval obtained from the local authority.

### 4.9. Impact of Retained Trees on the Development

- 4.9.1. The foundations and any new surfaces should be designed to accommodate all potential impacts due to future tree rooting activity. These include potential vegetation related subsidence, vegetation related heave, and lifting of surfaces / light structures due to direct root pressure.
- 4.9.2. The proposed extension shall contain hotel rooms, for temporary guests, rather than rooms for permanent residents. Consequently, the shade cast by the adjacent trees is considered to be less relevant from a planning perspective.
- 4.9.3. The gutters will need occasional maintenance to avoid blockage. Consequently, proposed extension would benefit from the installation of controlled overflow guttering to minimise the impact from leaves.

#### 4.10. Summary

- 4.10.1. In order to facilitate the development, it is proposed to remove three Retention Category C trees. These are all small trees with a relatively low amenity value. Consequently, the impact of tree removal on local amenity shall be minimal. Several new trees are to be planted to mitigate against tree removal and to ensure tree cover is maintained throughout the site.
- 4.10.2. It is proposed to prune back the branches of T18, T20 and G21 (2 trees) are growing towards the proposed extension, in order to create a clearance distance of 2.5m.
- 4.10.3. A new hard surface is proposed within the RPA of T10. However, it is also proposed to lower ground levels in this area which shall require the severance of any roots encountered.
- 4.10.4. Wall and bike store foundations are proposed within the Root Protection Area of several trees. However, the sympathetic excavation methods and foundation design shall ensure minimal impact on trees.
- 4.10.5. The lowering of ground levels and reconstruction of retaining walls is proposed within the RPAs of several trees. However, the sympathetic excavation methods shall ensure minimal impact on trees.
- 4.10.6. A suitable load spreading surface shall need to be maintained throughout the Restricted Activity Zones A.
- 4.10.7. Tree protection measures are specified throughout the accompanying Arboricultural Method Statement that will ensure no negative impact on retained trees due to construction activity.

### Appendix 1: BS 5837: 2012 – Guidance Notes

This Standard prescribes the principles to be applied to achieve a satisfactory juxtaposition of trees and structures. It sets out to assist those concerned with trees in relation to design, demolition and construction to form balanced judgements.

It acknowledges the positive contribution trees may offer to a site, as well as the negative aspects of retaining inappropriate trees. It addresses the negative impacts that construction activity may have upon trees and offers mitigation strategies to minimise these impacts.

The Standard suggests a three stage approach to ensure best practice is followed when developing close to trees:

### A1.1 Stage 1: Survey Details and Notes

A ground level visual survey was undertaken. No climbed inspections or specialist decay detection were undertaken. Only trees with a stem diameter over 75mm, which lie within the site boundary or relatively close to it, were included.

Where applicable, trees with significant defects have been highlighted and appropriate remedial works have been recommended. However, this report should not be seen as a substitute for a full Safety Survey or Management Plan which are specifically designed to minimise risk and liability associated with responsibility for trees.

Wherever practicable dimensions were obtained using diameter tapes, logger's tapes, distometers and clinometers. Where obstacles prevent accurate measurement, dimensions are estimated. Trees on privately owned third party are surveyed from the best available vantage point and observations relating to the condition of these trees should be treated accordingly. All height measurements should be regarded as approximate.

Data is recorded for each tree and is presented in a Tree Data Schedule. Each tree is allocated a **Retention Category** according to its size, amenity value, condition and safe useful life expectancy. The categories are allocated independently of development proposals. Our interpretation of the Retention Categories is explained below:

#### A1.1.1 Retention Categories

**A Category:** Trees of high quality and amenity value. Usually, mature trees with a significant life expectancy which would enhance any development. Retention of these trees is strongly encouraged.

**B Category:** Trees of moderate quality and amenity value. Usually these are maturing trees or younger trees with exceptional form. Retention of these trees is desirable though the removal of occasional specimens may be acceptable.

**C Category:** Trees of low quality or small specimens with a relatively low amenity value. These trees are not considered to be a material planning constraint and their removal will generally be seen as acceptable in order to facilitate development.

**U Category:** Trees of such low quality that their removal is recommended regardless of development proposals.

Occasionally trees are borderline and do not fall neatly into one of the categories A, B or C. In such cases we apply a superscript (+/-) such that:

C<sup>+</sup> Indicates borderline C/B, though Category C is deemed to be most appropriate.

**B**<sup>-</sup> Indicates borderline C/B, though Category B is deemed to be most appropriate.

Crown Ref: 010313 Site: The Rose Of York, Petersham Road, Richmond

Author: Joe Taylor Date: 27<sup>th</sup> July 2021

The British Standard suggests that each of the A, B and C categories may be further subdivided (A1, A2, A3, B1, B2, B3 etc) such that subcategory 1 denotes mainly arboricultural values, subcategory 2 denotes mainly landscape values and subcategory 3 denotes mainly cultural values (including conservation). Multiple subcategories may be used.

Our experience suggests that these subdivisions lack clarity and can be confusing. Within this report subcategories are **not** denoted. Where appropriate, the use of phrases such as 'Part of a formal group', or 'Has a high ecological value', or 'Offers good screening to the site' are incorporated into the observation section of the Tree Data Schedule. We believe this conveys all relevant landscape and cultural information without any confusion.

**Tree Constraints Plan (TCP).** This indicates the position, crown spread, Retention Category and Root Protection Area of each tree. It is used to inform where development may proceed without causing damage to trees.

**Root Protection Area (RPA).** This is the area around each tree likely to contain the majority of roots. It should ideally remain undisturbed to avoid a detrimental impact on tree health. For single stemmed trees It is calculated according to the formula "radius of RPA" = "12 x stem diameter". Where a tree has more than one stem, the equivalent-single-stem diameter is usually recorded. This is calculated by adding the squares of the stems and then finding the square root of this total. The radius of the Root Protection Area is then calculated by multiplying the equivalent-stem-diameter by 12.

**Shade Constraints.** The previous Standard (BS 5837 2005) suggested that shade constraints should be indicated on the TCP. This are denoted as a circle-segment drawn northwest to due east with a radius equal to the height of the tree. These do not represent the actual shade pattern which varies through the seasons. Rather, they indicate the area most shaded by the tree throughout the course of the year. Ideally habitable room windows should be located outside of these shade constraints. Where we consider it appropriate, we will include shade constraints information on our Impact Assessment Plan or Proposed Layout Plan.

#### A1.2 Stage 2: Arboricultural Impact Assessment

After the initial survey and the production of the Tree Constraints Plan, arborists and designers are encouraged to work together to establish a design proposal with minimal impact on the high quality trees. An assessment should be made of all possible impacts including the impact that the trees may have upon the proposal. The arborist may recommend mitigation strategies to minimise these impacts and help achieve a more harmonious juxtaposition between buildings and trees.

#### A1.3 Stage 3: Arboricultural Method Statement

This type of report specifies the measures necessary to protect trees against damage from construction activity. The Method Statement should be written in a manner that it may be conditioned and enforced by the local authority upon granting of planning permission. The site manager should be familiar with all aspects of the Method Statement and should ensure that all persons working on the site are aware of those aspects which appertain to their work. This includes service installation engineers and operators of plant machinery.

Author: Date: 27<sup>th</sup> July 2021 Joe Taylor

### **Appendix 2: Explanation of Tree Data & Glossary**

This section explains the terms used in the Tree Data Schedule (see Section 3 and Appendix 6).

#### **General Observations** A2.1

**Numbering System:** Each item of vegetation has its own unique number prefixed by a letter such that T1=Tree 1, G2=Group 2, H3=Hedge 3 and

W4=Woodland 4, S5=Shrub 5.

Age Categories:

Usually less than 10 years old. Young

Semi-Mature Significant future growth to be expected, both in height and crown spread (typically below 30% of life expectancy). Early-Mature  $Full\ height\ almost\ attained.\ Significant\ growth\ may\ be\ expected\ in\ terms\ of\ crown\ spread\ (typically\ 30-60\%\ of\ life\ expectancy).$ Mature Full height attained. Crown spread will increase but growth increments will be slight (typically 60% or more of life expectancy).

Veteran A level of maturity whereby significant management may be required in order to keep the tree in a safe condition.

**Over Mature** As for veteran except management is not considered worthwhile. Common names and Latin names are given.

Height: Measured from ground level to the top of the crown.

Stem Diameter: Taken at 1.5m above ground level where possible. On multi-stemmed trees this measurement may be taken at ground level,

though usually an indication of the number of stems and average diameter is given, e.g. 3 x 30cm.

Crown Height: Measured from ground level to the height at which the main crown begins. Where the crown is unbalanced it is measured on the

side deemed to be most relevant. This is usually the side facing the area of anticipated development.

Tree Diagram: This scaled drawing is computer generated based on measurements taken for stem diameter, crown height and spread, and

overall height. It is designed to help the reader rapidly assess the data. It is not an accurate representation of the form of the

Crown Spread: Measured N, E, S & W, taken from the centre of the stem and usually rounded up to the nearest metre.

Observations: If a tree's position is considered to be relevant it will be commented upon (e.g. overhanging a children's play area). Tree form

and pruning history are also recorded along with an account of any significant defects. Defects and descriptive terms are dealt

with in more detail at the end of this section.

Usually based on any defects observed and intended to ensure that the tree is in an acceptable condition. Recommendations:

**Priority Scale:** Depending upon the threat posed by the tree, and the likelihood of failure, recommendations should be carried out according to

the following priority scale:

Urgent To be carried out as soon as possible. Very High To be carried out within 1 month. High To be carried out within 3 months Moderate To be carried out within 1 year. To be carried out within 3 years

Inspection Frequency:

An interval of 6 months, 1 year, 1.5 years or 3 years is allocated before the next inspection is due. Wherever practical, consideration should be given to seasonal changes so that deciduous trees are not always surveyed in winter when they have no

leaves, or in summer when leaves may obscure branches within the upper crown.

An indication of growth rate and the tree's ability to cope with stresses: Vigour:

High Having above average vigour. Moderate Having average vigour. Having below average vigour.

Tree is struggling to survive and may be dying. Verv Low

Physiological Condition:

Good Healthy and with no symptoms of significant disease.

Fair Disease present or vigour is impaired

Significant disease present or vigour is extremely low. Poor Very Poor Tree is dying.

Structural Condition:

Having no significant structural defects. Good

Some defects observed though no high priority works are required. Poor Significant defects found. Tree requires monitoring or remedial works.

Very Poor Major defects which will usually require significant remedial works or tree removal.

**Amenity Value:** 

Very High Exceptional specimen, observable by a large number of people. Attractive specimen, observable by a significant number of people. High

Moderate One of the above factors is not applicable. Low Unattractive specimen or largely hidden from view.

The estimated number of years before the tree may require removal. Classified as (<10), (10 - 20), (20 - 40), or (40+). Life Expectancy:

Retention Category: These are explained in detail in Appendix 1.

#### **Evaluation of Defects** A2.2

Cavities, wounds, deadwood etc are all evaluated as follows:

Such that structural integrity is, or will become, compromised and the tree is, or will inevitably become, hazardous. Major

Significant A defect that may over time become a major defect, though not necessarily so. This will depend on the vigour of the tree and its

ability to deal with decay etc.

Minor A defect that is not likely to compromise the tree's structural integrity.

Crown Ref: 010313 Site: The Rose Of York, Petersham Road, Richmond

### **General Glossary**

Aerobic Conditions in which oxygen is freely available, or to biomechanical processes that depend on the presence of oxygen. Anaerobic A condition marked by the absence of oxygen; Generally such areas are unsuitable for normal life an growth of plant These sites tend to be populated by bacteria capable of surviving low oxygen conditions often associated with Slime FI Arboriculture Arboriculture The culture and management of trees as groups and individuals primarily for amenity on the management of tree other woody plants in a landscape setting. Generally involved with the development or management of tree other woody plants in a landscape setting. Generally involved with the development or management of tree for visus or land management rather than the growth of trees for product or profit.  Barrier zone A layer within an annual increment of wood which contains abnormal xylem cells, laid down by the cambium in responsor wounding or other trauma.  Body language Body language Body or Trunk, the main stem of a tree below its first major branch.  A type of fruiting body produced by various fungal species, plate like to hoof like in shape and often a one sided attach the wood or bark.  A ridged area located at the union of a branch to a trunk or stem.  A ridged area located at the union of a branch to a trunk or stem.  Brown Rot Form of decay where cellulose is degraded, while lignin is only modified.  Buttress Root Good that tenser from the base of the tree stem, normally large and well developed that rapidly reduce in diameter the Root Plate this offers structural support for the tree. Buttress roots divide rapidly forming the connection between and the transport roots.  Cabling Bracing  Callius Undifferentiated cells often formed at the edges of recent injuries. This tissue quickly becomes differentiated, forming the characteristic of that position on the tree (e.g. forming wood, bark, roots, etc.) see wound response tissue.  A hope characteristic of that position on the tree (e.g. forming wood, bark, roots, etc.	s or amenity e to nent to
Anserbic Acondition marked by the absence of oxygen; Generally such areas are unsuitable for normal life an growth of plant These sites tend to be populated by bacteria capable of surviving low oxygen; conditions often associated with Slime F Arborist The culture and management of trees as groups and individuals primarily for amenity and other non-forestry purposes of the culture and management of trees as groups and individuals primarily for amenity and other non-forestry purposes or land management or tree other woody plants in a landscape setting. Generally involved with the development or management of trees for broduct or profit.  A layer within an annual increment of wood which contains abnormal sylem cells, laid down by the cambium in respon wounding or other trauma.  Body language Bole Or Trunk, the main stem of a tree below its first major branch. Branch bark ridge Branch Collar Trunk tissue that forms around the base of a branch between the main stem and the branch, or between a main branch lateral branch. As a branch decreases in viguour or begins to dile, the collar usually becomes more pronounced and compenitories the branch.  Brown Rot Form of decay where cellulose is degraded, while lignin is only modified.  Buttress Root Roots that emerge from the base of the tree stem, normally large and well developed that rapidly reduce in diameter the Root Plate this offers structural support for the tree. Buttress roots divide rapidly forming the connection between and the transport roots.  Loabling Bracing Callus  Lindifferentiated cells often formed at the edges of recent injuries. This tissue quickly becomes differentiated, forming the characteristic of that position on the tree (e.g., forming wood, bark, roots, etc.) see wound response tissue.  A thin layer of actively growing and dividing cells, located between the xylem (sapwood) and bark of a plant; the part responsible for readial growth of a rease term or branch.  Canopy The topomost layer of twigs and follage in a woodland, tree or group of trees.	s or amenity e to nent to
Arborist A person possessing the technical competence through experience and related training to provide management of tree of the woody plants in a landscape setting. Generally involved with the development or management of tree of the woody plants in a landscape setting. Generally involved with the development or management of tree of the woody plants in a landscape setting. Generally involved with the development or management of tree of the wood which contains abnormal xylem cells, laid down by the cambium in response to mechanical stress.  Body language In trees, the outward display of growth responses and or deformation in response to mechanical stress.  Or Trunk, the main stem of a tree below its first major branch.  Bracket A type of fruiting body produced by various fungal species, plate like to hoof like in shape and often a one sided attach the wood or bark.  Branch Bark ridge Branch Collar  Trunk tissue that forms around the base of a branch to a trunk or stem.  Trunk tissue that forms around the base of a branch between the main stem and the branch, or between a main branch lateral branch. As a branch decreases in vigour or begins to die, the collar usually becomes more pronounced and compended the properties of the tree stem, normally large and well developed that rapidly reduce in diameter the Root Plate this offers structural support for the tree. Buttress roots divide rapidly forming the connection between and the transport roots.  Cabling Bracing  Callius  Undifferentiated cells often formed at the edges of recent injuries. This tissue quickly becomes differentiated, forming the type characteristic of that position on the tree (e.g. forming wood, bark, roots, etc.) see wound response tissue.  Cambium  A thin layer of actively growing and dividing cells, located between the xylem (sapwood) and bark of a plant; the part responsible for	s or amenity e to nent to

Crown lifting / Crown Lift The removal of the lowest branches, usually to a given height. It allows more residual light and greater clea	
raising underneath for vehicles etc.	nce
Crown reduction The reduction of a tree's height or spread while preserving its natural shape.	ınce
Crown thinning The removal of some of the density of a tree's crown, usually 5-25% allowing more light through its canopy and reducin resistance.	
Deadwood (noun)  Deadwood is often present within the crown or on the stems of trees. It may be an indication of ill health, however, it indicate natural growth processes. If a target is present beneath the tree, deadwood may fall and cause injury or dama should be removed, otherwise deadwood can remain intact for conservation purposes (insects, fungi, birds etc.).	
Deadwood (verb) The removal of dead branches from a tree's canopy, usually of a specified size (in diameter).	wind ay also
Decay Progressive deterioration of organic tissues, usually caused by fungal or bacterial organisms, resulting in loss of cell strength, and function. In wood, the loss of structural strength.	wind ay also
Decay Detection  The assessment of decay within a tree has been traditionally difficult, but recent advances have made it possible to ach accurate representations of the internal section of a tree in both 2D and 3D, removing doubt over the condition of the allowing accurate management decisions.	wind ay a Iso e and

27<sup>th</sup> July 2021 Author: Joe Taylor Date:

	extreme cases can result in Stag Heading.
Dripline	A projected line on the ground that corresponds to the spread of branches in the canopy; the farthest spread of branches.
Epicormic shoots	Fast growing, weakly attached shoots/branches that often grow as a response to stress factors upon a tree or branch removal.
Failure	In connection with tree hazards, a partial or total fracture within the wood tissue or loss of cohesion between roots and soil. (In
	total failure affected parts will snap or tear away completely, Partial failure there is a crack or deformation, which results in an altered distribution of mechanical stress.
Feeder Roots	Fine fibrous Water and nutrient absorbing roots located in the outer root system.
Flush-Cut	In trees and shrubs, a pruning cut close to the parent stem, which removes the branch bark ridge.
Foliage	The live leaves or needles of the tree; the plant part primarily responsible for photosynthesis.
Formative pruning	The trimming of a tree to remove weaknesses and irregularities which may lead to problems. The formative pruning operation is aimed at reducing the
Gall	<ul> <li>potential for future weaknesses or problems within the tree's crown.</li> <li>An abnormal, disorganized growth of plant tissues, caused by parasitic or infectious organisms such as insects, fungi, bacteria, or viruses.</li> </ul>
Girdling	In woody plants, any form of damage that destroys the bark and / or the Cambium all the way around the stem, branch or root, normally resulting in death of the damaged section.
Girdling Root	In woody plants, a root that grows across the buttress, or across other roots, eventually causing constriction of the radial growth.
Growth Increment	The incremental growth added as new annual ring develops each season over existing wood. This is seen as (growth) rings in cross-sections of wood.
Hazard beam	An upwardly curved branch in which strong internal stresses may occur without the compensatory formation of extra wood (longitudinal splitting may occur in some cases).
Heartwood	Inner non functioning tissues that provide structural support to trunk.
Heave	In relation to shrinkable clay soils, expansion due to rewetting of a volume of soil previously subjected to the removal or water by plant / trees following felling or root severance. Also in relation to root growth, the lifting of pavements and other structure by radial expansion. Also in relation to tree stability, the lifting of one side of a wind rocked root plate.
Herbicide	A chemical compound that causes the death of a plant.
Included Bark	Bark that becomes embedded in a crotch between branch and trunk or between co-dominant stems, usually found in narrow or tight crotches, and causes a weak structure.
Increment Borer	A tool that cuts and extracts a narrow cylinder of wood from a tree for analysis of the wood tissue and growth increments.
Leader	The primary terminal shoot or trunk of a tree.
Limb	A large lateral branch growing from the main trunk or from another larger branch.
Lion Tailing	Often the result of poor pruning practices; the main leader or branches are largely devoid of side branches, growth is restricted to the end of branches and is likely to suffer damage through end loading.
Lopping	In trees, a general term that related to the removal of branches from a tree.
Monitoring	Due to the relative life span of trees in relation to our own, long-term monitoring provides a valuable insight to the health of trees, identifying decline and or stabilisation and or improvement.
Mulch	A material laid over the root system of a tree to help conserve moisture within the soil. Additionally it may help control the development of weeds close to the tree.
Mycelium	A mass of growing filaments (hyphae) formed by fungi.
Mycorrhizae	The symbiotic relationship between roots and certain beneficial fungi. Mycorrhizae are the combined root / fungal growth.
Occluding tissue	The general tern of wood, cambium and bark that develop around the site of a wound on a woody plant
Pathogen	A microorganism that causes diseases within another organism.
Phloem	The principle conductive tissue that the products of Photosynthesis are transported around the plant
Photosynthesis	The process were light energy is used to create energy (Carbohydrate) for use within the plant.
Pollard	A term for a pollarded tree.
Pollard head Pollarding	The swollen section of branch / stem that forms behind the pollarding cut.  The complete or partial removal of the crown of a young tree so as to encourage the development of numerous branches either
Prune or Pruning	for amenity or historically as fodder, repeated management is required cyclically to maintain the feature  Selective removal of woody plant parts of any size, using saws, Loppers, Secateurs, or other pruning tools.
Reaction Wood	Wood with distinctive anatomical characteristics, formed in parts of leaning or crooked stems and in branches to provide additional strength / support. In hardwoods, tension wood usually forms. In conifers, compression wood is usually found.
Reaction Zone	A zone normally darker than surrounding wood that denoted the boundary often a defensive one between functional sapwood and dysfunctional or decaying wood.
Re-grading	The raising or lowering of a soil profile from its original grade.
Remedial pruning	The removal of old stubs, deadwood, epicormic growth, rubbing or crossing branches and other unwanted items from the tree' crown.
Resistograph Rib	Invasive decay detection technique whereby the resistance offered by the timber to a spinning probe is measured and plotted.  In tree body language, a long narrow, axial protuberance which often over lays a crack.
Ring Barking	Artificial Girdling of the stem, to result in the death of a tree. May be used in habitat creation were the retention of dead standing trees is required.
Rod Bracing /	Traditionally, this has relied upon the Installation of steel rods or bolts through the stems or limbs, to reduce twisting or
Bolting	splitting of the wood. The installation of such features does require legal interpretation.
Root Barriers	Both Buildings and services can benefit from the installation of root barriers to protect a soil volume from the ingress of roots.
Root Collar Root Plate	The basal area of the tree; transition zone from trunk to root. Also sometimes called trunk flare. The primary support area for the tree; an area of the root system close to the base that structurally anchors the tree to the soil.
Root Rot	Either a general term for decay within the wood of the lower stem / buttress roots, or a disease in which the fine roots are
Root System	killed. The portion of the tree containing the root organs, including buttress roots, transport roots, and fine absorbing roots; all underground parts of the tree.
Root Zone	The area and volume of soil around the tree in which roots are expected. May extend to three or more times the branch spread
	of the tree, or several times the height of the tree.

Site: The Rose Of York, Petersham Road, Richmond Date: 27<sup>th</sup> July 2021 Crown Ref: 010313

Joe Taylor Author:

Sapwood	Xylem wood tissue, usually light in colour, representing the outer growth rings of the wood. Usually living, reactive wood tissue
•	in a healthy tree. See heartwood
Scaffold limbs / scaffold Branches	The branches that from the main network framework of the crown of a tree.
Senescent	A decline in growth and vigour due to age or stress factors.
Shrub	A woody plat that branches at or close to the ground level and so does not have a single stem.
Slime Flux	Relating to a toxic condition from the spreading of bacteria or their products from a source of infection; characterized by malodorous gases, or salt deposits upon the bark. If these products enter the sap stream, localised vessel necrosis can result, usually associated with anaerobic conditions.
Soft Rot	A kind of wood decay, were a fungi degrades cellulose within the cell wall, without causing overall degradation.
Soil Compaction	The compression of soil, causing a reduction of pore space and an increase in the density of the soil. Air is squeezed out and nutrients become locked. Tree roots cannot grow in compacted soil.
Sonic Decay	Non invasive method whereby sound waves are passed through the tree and the speed is measured. Slow speeds indicate decay
Detection	and a tomography picture representing the inner stem is produced.
Stag Heading	In a tree, a state of dieback were dead branches protrude beyond the current living crown.
Stress	In plant physiology, conditions were one or more physiological functions Are not working within normal parameters.
Stump Grinding	The removal of a tree stump using a specialist grinding machine.
Subsidence	In relation to vegetation, the removal of water by plant growth resulting in localised shrinkage in the soil volume.
Sucker	Same as sprout.
Suppressed	Trees which are dominated by surrounding vegetation and whose crown development is restricted from above.
Systemic	Affecting the whole plant or organism. A systemic compound is carried throughout the entire plant to all parts through the vascular system.
Target	Any person or object within reach of a falling tree or part of a tree that may be injured or damaged.
Target Pruning	The pruning of a branch were the wound affects only branch material, often result in a target shaped wound.
Tension Wood	Reaction wood typically formed on the upper side of limbs or curved stems; characterized by lack of cell wall lignifications (higher ratios of cellulose to lignin).
Tight Union / Tight Crotch	Also, narrow crotch. A crotch with a narrow angle between branches, often having included bark.
Tomography	The comparison of sound or stress waves through the tree allows the creation of a 2D or 3D representation of the internal structure of a stem or branch section and highlights areas of damage. Virtually non-injurious.
Topography	The configuration of surface features, including the vertical and horizontal relationships of the ground and other features.
Topping	Cutting large limbs back severely, without regard to form or habit of the tree. Cuts are usually made between lateral branch nodes. This practice is extremely injurious to trees, and promotes decay and structural weakness within the crown.
Tree	A woody plant that typically has a single stem, at maturity has a height of a least 4 metres and a stem diameter at breast height of at least 75mm.
Tree Preservation	In Great Britain, an order made by the local planning authority, were consent must be gained before undertaking all but exemp
Order	works to a tree.
Trunk Flare	The basal area of the trunk that flares or widens, and merges with the main roots. See root collar
Veteran Tree	Veteran trees are often found in large parks or estates and commonly affected by extensive decay or have been subject to extensive works. These trees are retained for historical importance and often pose greater risk than normal, which is generally justified. They need careful management and often propping or bracing to support them, some require fencing to limit access.
Vigour	Active, healthy growth of plants: ability to respond to stress factors.
Visual Tree	An assessment of the mechanical condition of trees based upon their 'body language'. Trees are dynamic and respond to faults
Assessment (VTA)	decay / environmental factors in various ways, these responses can be indicative of structural integrity.
Wetwood	An infection caused by bacteria living inside the plant tissues. The bacteria ferment the plant fluids, resulting in death of nearby cells, and often causing exudations of fluid from the bark, often referred to as a Slime Flux.
White Rot	A kind if wood decay were a fungi attacks the lignin within the wood matrix
Wind loading	Forces placed upon tree canopy, branches, trunk and roots of a tree under windy conditions.
Wind Throw	The failure of a tree due to wind loading.
Witches Broom	A deformed or unusual growth of twigs from adventitious buds, caused by insects, disease, or dieback of twigs and buds.
Wood	Secondary Xylem; the main structural support and water conducting tissue of trees and shrubs.
Wound Response	Also Occluding Tissue, Wound Wood or Callus. Differentiated wood tissue that grows around the margins of a wound or injury.
Tissue	
Wound Wood	Wood with atypical features, formed in the vicinity of a wound and a term to describe the occluding tissues around a wound

### **Appendix 3: Survey Methodology**

Ground level visual surveys are carried out using the *Visual Tree Assessment* technique described by Mattheck and Broeler (1994) and endorsed by the Arboricultural Association (LANTRA Professional Tree Inspection course, 2007).

Structural condition is assessed by inspecting the stem and scaffold branches from all angles looking for weak branch junctions or symptoms of decay. Particular attention is paid to the stem-base. Cavities are explored using a metal probe in order to assess the extent of any decay. If this is not possible further inspection is recommended in the form of a climbed inspection or using specialist decay detection equipment.

The physiological condition is assessed by inspecting the stem, branches and foliage for symptoms of disease. The overall vigour of the tree is also taken into account.

Where significant defects are observed, recommendations are made according to a scale of priority in order to reduce the likelihood of structural failure. The position of the tree and its potential targets are taken into account.

Measurements are obtained using a diameter tape, clinometer, distometer and loggers tape. Where this is not practical measurements are estimated.

Some trees are surveyed as groups, though this is usually avoided close to areas likely to be developed.

Finally, a Retention Category is allocated as described in Appendix 1.1.1.

### **Appendix 4: Author's Qualifications**

#### Qualifications & Experience of Ivan Button N.C.H. (Arb), FDSc (Arb), BSc (Hons), P.G.C.E., M. Arbor. A.

Between 1983 and 1995 Ivan worked primarily within the construction industry and received training in a broad range of practical building skills and general construction principles. During this time he obtained a BSc (Hons) at Leeds University followed by a P.G.C.E at The University of Wales.

In 1995, Ivan obtained a NCH (Arboriculture) at the University of Lincoln and became a member of the Arboricultural Association. He then worked for an Arboricultural Consultancy for one year before establishing a tree surgery and landscaping business in 1998. In 2005 Ivan commenced full time employment with a leading Arboricultural Association approved consultancy and soon adopted a senior role responsible for five consultants.

He obtained a FDSc in arboriculture at the University of Lancashire, which he passed with distinction and is now a Director and Principal Consultant of Crown Consultants Ltd. He is accredited as a LANTRA *Professional Tree Inspector*. A qualification produced in association with the Arboricultural Association and generally recognised as appropriate for all levels of tree inspection.

Ivan is a professional member of the Arboricultural Association, the International Society of Arboriculture and the Consulting Arborist Society

Ivan is trained and licensed in QTRA (Quantified Tree Risk Assessment). He has undertaken professional expert witness training provided by Bond Solon and has been registered as a Sweet and Maxwell Checked Expert Witness from 2008-2017, after which the service was no longer offered.

Throughout 2009 acted as the principal Tree Officer for Barnsley Metropolitan Borough Council.

Ivan has produced several hundred Arboricultural Reports for the purposes of Development, Safety, Management, Mortgage, Subsidence, Mitigation and Litigation.

#### Qualifications & Experience of Emma Hoyle FDSc (Arboriculture), ED (Forestry & Arboriculture), M. Arbor. A.

Emma is a qualified Arboricultural Consultant educated to Level 5 in Arboriculture at Askham Bryan College and is a professional member of the Arboricultural Association. She has worked for Crown Consultants since 2015 and has since written numerous reports relating to all aspects of arboriculture including; planning and development, vegetation related subsidence, tree preservation orders and tree risk assessment. Emma regularly attends seminars and events in order to keep abreast with current knowledge and best practise in Arboriculture.

Prior to becoming an arboricultural consultant, Emma worked for two reputable tree surgery firms from 2008 and became an NPTC Qualified tree surgeon after completing a Level 3 Extended Diploma in Forestry and Arboriculture at Askham Bryan College. Emma also has experience in other areas of arboriculture such as forest clearance, tree planting, tree maintenance and landscaping.

#### Qualifications & Experience of Joe Taylor - MArborA, FdSc (Arboriculture)

Joe began his career in Arboriculture as a tree surgeon/climber. During his time as a tree surgeon, Joe has achieved City & Guilds NPTC qualifications in Chainsaw Maintenance and Cross Cutting, Tree Climbing and Rescue, Safe Use of Manually Fed Wood-chipper and Supporting Colleagues Undertaking Tree Related Operations.

Joe obtained a Foundation Degree in Arboriculture at Askham Bryan College in 2015 which he passed with merit. Joe is a professional member of the Arboricultural Association, the International Society of Arboriculture and the Royal Forestry Society and regularly attends industry related seminars in order to keep abreast of industry best practice.

Studying at Askham Bryan College reinforced Joe's passion for trees and drove his enthusiasm to learn more. Learning how trees interact with their surrounding environment and their importance within our urban and rural landscapes highlighted an interest in pursuing a career in consultancy.

Since working for Crown Consultants Joe has undertaken numerous surveys and produced numerous reports for the purpose of planning (BS 5837), tree condition surveys, subsidence risk assessments, root surveys and decay detection investigations.

CROWN

Arboricultural Consultants Category U tree

Tree Retention Categories Stems & canopies shown Category A tree Category B tree Category C tree

Trees of high quality with an estimated life expectancy of 40+ years.
Usually large trees with significant presence or smaller trees with excellent form. Retention of these trees is highly desirable. Trees of moderate quality with a life expectancy of 20+ years.
Usually maturing trees, or younger trees with good form. Retention of these trees is desirable though less than Category A trees

Trees unsuitable for retention due to their very poor condition.

Unremarkable trees of low quality and merit. Individual specimens

### **Tree Protection Barriers**

The purpose of tree protection barriers is to keep construction activity away from Restricted Activity Zones or Construction Exclusion Zones. They should be appropriate to the nature and proximity of activity within the site. The barriers should be erected prior to the commencement of all activity including demolition, soil stripping and delivery of materials and demolition (except where existing Ground Protection Measures structures require demolition to enable the barriers to be installed). Barrier systems are specified below and should be installed according to the legend on the Tree Protection Plan.

The In-Ground System This system may be installed where indicated by a solid purple line on the Tree Protection Plan. It should be robust enough to withstand occasional knocks by plant machinery and, once installed,

and diagonal bracing struts. Weldmesh panels (or similar – e.g. Heras type fencing panels, or 18mm+ the hard surfacing must be firm enough to spread the load of any traffic passing overhead. plywood boards) are secured to this scaffold framework using sturdy clips e.g. standard scaffold

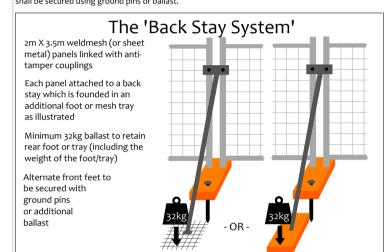

Where only pedestrian traffic will occur, the ground protection measures may be as simple as timber clips. The system is illustrated in the diagram to the right and is based on BS 5837 guidelines.

# The Back-Stay System —— ——

This system may be installed where indicated by a solid or dashed purple line on the Tree Protection Plan. It is more practical over existing hard surfaces or where the fencing needs to be moved to enable permitted activities within a Restricted Activity Zone. This system should be able to withstand occasional knocks by machinery and should not be relocated except with the consent of the site manager and the approval of the local authority.

Within this system, weldmesh fencing panels (minimum height 2m) are affixed into rubber or concrete feet and clipped together with anti-tamper couplers. Two couplers should be used, spaced at least 1m apart. Alternate panels should be attached to a diagonal back stay connected to an additional foot or baseplate secured with ground pins or additional ballast. Where ground pins are not used, the total weight of the foot/plate plus ballast should total not less than 32kg. Where it is not possible to install diagonal struts (such as very close to a hedge) then the front feet shall be secured using ground pins or ballast.

#### Suitable weather-proof notices should be displayed to identify tree protection zones. They should state the purpose of the fencing and that it should not be moved, or traversed, other than by

# Author: Joe Taylor FdSc (Arboriculture), M. Arbor A

Client: Cunnane Town Planning

## **Removal of Tree Protection Barriers**

#### Removal of protective fencing or ground protection measures shall be done after all major construction work is complete and their removal has been approved by the appointed arborist.

Within Restricted Activity Zones, soils containing roots may be subject to compaction due to general construction activity (including pedestrian activity and use of plant machinery). In order to minimise compaction, it is proposed to ensure that a suitable load-spreading surface is in place at all times. Any existing hard surfacing may be retained and reinforced (where applicable and adequate), otherwise suitable new ground protection measures shall be installed. The ground protection shall need to be able to adequately spread the load of construction traffic. Where existing hard surfacing Vertical scaffold poles are driven into the ground, onto which are affixed horizontal scaffold poles is to be retained, it shall not be necessary to install additional ground protection measures. However,

boards, or scaffold planks installed directly onto a geotextile fabric on the ground. The ground should first be made even by raking, or by adding a few centimetres of sand or woodchip. Alternatively the boards may be supported by a scaffold framework. The scaffold may be founded on poles driven into the ground and/or onto blocks (to raise the scaffold) with additional couplings to

Where only light vehicles are to operate (e.g. barrows, trolleys or occasional cars), thick wooden boards or scaffold planks should also suffice, though at least 150m of compressible woodchip will  $need\ to\ be\ installed\ first\ to\ help\ spread\ the\ load.\ Sturdier\ systems\ are\ specified\ below:$ Where cars will regularly park or heavier vehicles/plant machinery will occasionally operate, sturdier ground protection measures will be required such as metal road plates, or purpose built synthetic

oad mats over a compression resistant layer such as 150mm of woodchip or 100mm of a 3D cellular confinement system in-filled with 7-40mm angular gravel (e.g. CellwebTM). A temporary concrete slab may also be considered as a suitable load spreading platform. Where a pile driver needs to operate, a concrete slab may be the preferred option. Where existing structures need to be removed, this shall be done with temporary ground protection

neasures in place to enable this to be achieved without compacting soils. The ground protection measures shall be installed and approved before commencement of demolition and construction activity and before the arrival of plant machinery or materials. They shall remain in place until all heavy construction activity is complete or until they are due to be replaced

### **Construction Exclusion Zones**

### Within Construction Exclusion Zones the following restrictions shall apply:

- Tree Protection Barriers shall be erected and maintained throughout the entire project as indicated on the Tree Protection Plan and under the header -Tree These shall remain in place at all times except when authorised landscaping works
- are being undertaken. At such times, all restrictions that apply to the Restricted Activity Zone shall apply. Furthermore, the project arborist shall be informed prior to any works being undertaken in these zones.
- No construction activity or excavation shall occur unless agreed otherwise by the project arborist and local authority.

• Removal of hard surfaces, structures or turf shall be done using hand operated tools

- No vehicles or plant machinery shall be driven or parked. No tree works, other than those specified in this report shall be undertaken
- No alterations of ground levels or conditions shall occur. No chemicals or cement washings permitted

only and supervised by the project arborist.

- No fires shall be permitted • All hazardous materials (including non-essential cement products) shall be forbidden
- No temporary structures shall be installed. No spoil shall be stored.

### **Tree Works Specification**

The following table specifies the tree works which will be required prior to the commencement of

Tree Reference	Action Required	Notes
T12, T13 and T14	Remove.	N/A
T18, T20 and G21 (2 trees)	Prune canopy to create a clearance distance of 2.5m from the proposal.	Branches to be pruned back to a secondary branch junction or the branch collar wherever possible.  Pruning to be kept to a minimum to achieve the desired clearance of 2m.

### **Restrictions in Specific Zones**

### **Restricted Activity Zone A**

Within this zone trees roots are likely to be present where access will be required to facilitate construction. The following restrictions shall apply:

specified under the heading Ground Protection Measures. This shall remain in place fires shall be permitted in the vicinity of any exposed tree roots. throughout the entire construction phase or until any new permanent hard surfacing is installed. Any pedestrian activity other than very occasional shall also require a Canopy Protection · Removal of existing structures such as, walls, steps and hard surfaces (where

from outside the Restricted Activity Zone and carefully marshalled by the project • No excavation shall occur beneath any existing hard surfacing and its sub-base or beneath the foundations of any structure such as wall, steps or patio.

• No further excavation shall occur in this zone without consulting the project arborist and obtaining approval from the local authority. • Existing ground levels shall be retained undisturbed or raised by no more than 150mm. Ground levels may only be raised using granular topsoil (not rich in clay) or where new surfacing is proposed.

on the planning application documents unless approved by the local authority. • Underground services shall not be installed in this area without prior consultation | materials (including non-essential cement products) shall be forbidden. with the project arborist and a methodology agreed and approved by the local • If roots are encountered in excess of 25mm diameter, they shall be retained Any mixing of cement based

wherever possible and protected with damp sacking during times that they are materials shall take place unearthed. Any roots in excess of 10mm that need to be severed shall be pruned with outside the Construction • Storage of materials and spoil shall be avoided unless it has been agreed with the Activity Zones. Where cemen project arborist that the ground protection measures are adequate to ensure no soil is to be mixed at considerable compaction or contamination occurs. All hazardous materials (including non-essential distances from trees and wate

### **Restricted Activity Zone B**

cement products) shall be forbidden.

In these zones it proposed to lower ground levels and rebuild the retaining wall. In the mixing area is contained so order to minimise the impact on roots, excavation should be undertaken using hand that no water run-off enters the new retaining wall. An example of this could be piling or pinning.

### Restricted Activity Zone C

Within this zone it is proposed to install a new wall. In order to minimise the impact on adjacent trees, the following restrictions shall apply: Only hand tools shall be used during the excavation.

 If roots in excess of 50mm diameter are encountered, they shall be retained • intact and the foundations designed accordingly. If roots in excess of 25mm are Statement and approved by the local authority. encountered, the majority shall be retained intact. A shallow beam shall be incorporated into the foundation design. This shall span over the larger roots, Site Hoarding

### Restricted Activity Zone D

#### In this zone it is proposed to lower ground levels within an existing planting bed and install a slab foundation for the new bike store. In order to minimise the impact on roots it is proposed to utilise the Hand-Dig Method. The following restrictions shall apply:

• Excavation shall be overseen by the project arborist. Hand tools shall be used during the excavation. The excavation shall not extend any closer to T<sub>17</sub> than is absolutely necessary.

 If roots in excess of 25mm diameter are encountered, they shall be retained wherever possible and protected with damp sacking during times that they are Site hoarding may be installed in place of the specified tree protection measures subject to the unearthed. Any roots that need to be severed shall be pruned with secateurs. If roots in excess of 50mm diameter are encountered they shall be retained intact

and the bike store foundation designed to accommodate them. The exposed roots Siting of Cabins shall be adequately shuttered off using timber and a suitable protective packaging Cabins shall be located outside of Construction Exclusion Zones and Restricted Activity Zones unless material such as damp cloth or polystyrene prior to any concrete being cast.

# **CROWN**

## **General Restrictions - Throughout the Site**

### **Preparatory Works**

ground protection measures are installed to the satisfaction of the local authority.

• No vehicles or plant machinery shall park or operate unless a suitable load spreading No fires shall be permitted beneath any tree canopy or within 5m of any tree stem, branch or foliage. surface is in place. The load spreading surface shall be installed and/or maintained as No fires shall be permitted within any Construction Exclusion Zone or Restricted Activity Zone. No

## In order to protect tree canopies the following restrictions shall apply throughout the site:

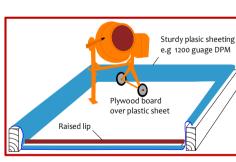

• No machinery in excess of 2m shall pass beneath the canopy of any tree without being carefully applicable) shall be undertaken using hand tools or a mechanical excavator operating marshalled in order to ensure that no branches are damaged. • If materials require installation or delivery beneath tree canopies, this shall be done without the

• If materials are to be installed or delivered close to tree canopies (but not beneath them) and a crane is required, they shall be carefully marshalled in order to ensure that branches are not

#### Storage of Spoil and Materials Storage of materials and spoil shall be avoided in any Construction Exclusion Zones and Restricted

 No new permanent or temporary structures shall be erected other than those shown
 Activity Zones unless it has been agreed with the project arborist that the ground protection measures are adequate to ensure no soil compaction or contamination occurs. All hazardous

run-off cannot enter Room Protection Areas, then n further special measures are required. Otherwise, provision

tools only and in a manner that does not disturb any of the soils beyond the footprint of the Root Protection Area of any trees (see diagram for example). Mixers and barrows shall be cleaned within this area. All other chemicals hazardous to tree health, including petrol and diesel, shall be stored in suitable

### Underground Services

No underground services (including soak-aways) shall be located in any part of the Construction Exclusion Zones or Restricted Activity Zones unless done so in a manner detailed in a specific Method

If site hoarding shall be installed over the Root Protection Area of any tree, the following restrictions

### Ground levels shall be maintained as existing.

- Post holes shall not exceed 300mm x 300mm. No post hole shall be excavated within 1.5m of any tree stem. Post holes shall be excavated using hand tools or by a post-hole auger attached to plant
- machinery sited outside of Root Protection Areas. Roots in excess of 25mm shall be retained wherever possible. Roots in excess of 10mm shall be pruned with sharp secateurs. Pruning shall be minimal and only undertaken where absolutely necessary to facilitate the site hoarding. It shall be undertaken by a reputable tree surgeon working to BS 3998 (2010).

approval of the local authority with regard to its location and specification.

- agreed otherwise by the project arborist. Where this is being considered, the project arborist shall be consulted and specific tree protection measures agreed. The following general restrictions will apply: All services to and from site cabins shall be installed above ground through any Root Protection
- No excavation shall occur within Root Protection Areas to enable cabins to be installed. The cabins shall be founded on a suitable load spreading surface.

### **Use of Heavy Plant**

All machinery operatives are to be made aware of any Construction Exclusion Zones and Restricted Activity Zones that apply to this site. All machinery operatives are to respect these zones and ensure that no damage occurs to trees due to the careless use of machinery. Mechanical excavators should have tracks rather than wheels to help spread their load. They should

be carefully marshalled when working close to tree canopies

### If scaffolding is required in areas containing ground protection measures, the protective boards shall

need to remain in-situ and be strengthened and stabilised to bear the weight of scaffold poles. Prior to the installation of any scaffolding within 0.5m of any tree branches, the project arborist shall be consulted to specify any pruning works that may be required.

# **Timing of Operations**

Activity within the site shall be phased according to the following chronology:

Order	Phase	Activity	
1st.		Planning conditions relating to trees to be identified and discussed with the Project arborist and site manager.	
2nd.		All specified tree removal and pruning to be undertaken (see Header -Tree Works Schedule).	
3rd.	Pre- Construction	Install the tree protection barriers (fencing and ground protection boards - see Headers -Tree Protection Barriers and Ground Protection Measures).	
4th.	Phase	Pre-Commencement site meeting: Tree protection barriers inspected. Additional protection measures to be agreed. Variances to be agreed. Location of underground services to be agreed. Boundary treatments to be agreed. Extents of excavation to be agreed. Scaffold restrictions to be agreed. Scope of future inspections / monitoring to be agreed.	
5th.		Arboricultural Method Statement to be revised and approved.	
Protection measures confirmed acceptable by the local authority			
6th.	Construction	Demolish existing structures and remove existing surfaces where applicable.	
7th.	Phase	Install new buildings, hard surfaces and services taking into account restricted activities as specified in this Arboricultural Method Statement.	
8th.		Site meeting with project arborist. Landscaping restrictions to be agreed. Condition of retained trees to be assessed and mitigation agreed. Ground conditions to be assessed and ground remediation to be agreed.	
9th.	Post- Construction Phase	Remove protective barriers (fencing and ground protection measures as applicable).	
10th.		Undertake restricted landscaping operations within Root Protection Areas, including (where applicable) boundary treatments, pedestrian surfaces, decking and any proposed tree planting.	

### **Site Monitoring Schedule**

Inspection	Site Attendees	Comments
Pre- Start Desk-top To occur prior to any works taking place on the site.	N/A.	Project Manager and Site manager to study this Method Statement & contact Project Arborist to agree all protection measures.
Pre-Start Meeting After tree works completed & tree protection barriers / ground protection measures installed. Prior to any other activity, inc. demolition & soil stripping.	Site manager, project arborist.  Tree Officer invited.	Tree protection fencing locations & specification checked. Additional ground protection measures checked. Further protection measures / restrictions agree
Excavation for the new bike store within Restricted Activity Zone D	Site manager, project arborist.  Tree Officer invited.	Two week's notice to be given prior to excavation.  Excavation to be as specified in this Method Statement.  Excavations to be recorded and photographed.  Mitigation measures to be employed specified by the project arborist.
Intermediate Inspection and Reporting Throughout the demolition and external construction phase.	Site manager and project arborist.*	Project manager, site manager and project arborist to liaise regarding any issue which may affect trees.  To occur at least once per month.
Post-Construction Meeting  Post external construction activity but prior to removal of fencing & landscaping operations.	Site manager, project arborist.  Tree Officer invited.	Retained trees inspected. Ground conditions assessed and mitigation measure agreed where appropriate. Further landscaping operations and restrictions to agreed.

\* Where agreed with the L.A. it may be acceptable to supply photographs of the fencing to avoid the
