Covered MUGA Project – Flood Risk Statement

The area in which the application site is situated is not identified as being at risk from fluvial flooding, or surface water flooding. The proposed development consists of a tensile membrane canopy, which will be constructed within the footprint of an existing tarmacadam multi-use games area. There will be no increase in impermeable surfaces as a result of the development.

The proposed canopy will have mesh side panels terminating just above ground level rather than solid sides, so in the event of any flooding the proposed structure would not have any impact on the flow or distribution of floodwater. This means that the proposed development will not have any impact on flood levels in any other location.
